## **Acknowledgements**

Quantitative Ecological Services, Inc. (QES) wishes to thank Gordon Leblanc, Program Administrator, Molluscan Shellfish Program, Office of Public Health, Louisiana Department of Health (LDH), Chris Lemaire, BEACH Program Manager, LDH, and Steve Backstrom, Beach Monitoring Program Coordinator, LDH, for their invaluable guidance and assistance during preparation of this report. Preparation of this document would not have been possible without the assistance, expert opinion and input of: Justin Gremillion, Chief Sanitarian, Special Operations, Environmental Health Services, Michael Vidrine, Director of Sanitarian Services, LDH, David Shane Burton, Louisiana Department of Environmental Quality (LDEQ), and Rob Cook with the U.S. Environmental Protection Agency. LDH also wishes to acknowledge the contributions of the Town of Grand Isle, the Cameron Parish Police Jury, Lafourche Parish Police Jury, Louisiana Office of State Parks, and the City of Lake Charles for their contributions to successful program implementation during 2019.

## EXECUTIVE SUMMARY

This document was prepared to partially fulfill the Louisiana Department of Health's (LDH; formerly known as Louisiana Department of Health and Hospitals [LDHH]), Office of Public Health, Center for Environmental Health Services (CEHS) reporting obligations under the U.S. Environmental Protection Agency's (USEPA) BEACH grant program, Federal Assistance Agreement Number CU-01F50501-0. Prior to publication of this report, the document was distributed to USEPA and the Louisiana Department of Environmental Quality for comments. The comments provided by both agencies were incorporated into this report. The report was made available to the public through CEHS's Beach Monitoring Program website (<http://www.dhh.louisiana.gov/index.cfm/page/288>).

As documented in *Louisiana's BEACH Grant Final Report – Grant Year 2001* (LDHH 2003; the Beach Report) and *Louisiana's Beach Program Quality Assurance Project Plan* (QAPP; LDH 2019), CEHS is to submit an annual technical report to USEPA after the end of the recreational period that summarizes the number of beaches monitored in each Tier, lists any additional beaches to be added to the Program or Tier reassignments to be made in the next year, presents a compilation of sampling results, and summarizes beach assessment activities and response actions. The report is to also include for Tier 1 and 2 beaches, the number of beach monitoring stations for which advisories were issued, the number of times beach advisory criteria were exceeded and the number of days under advisories for each beach monitoring station. This report satisfies the reporting obligations set forth in the Beach Report and outlined above.

Between 1 April 2019 and 31 October 2019, a total of 766 samples were collected at 23 sample stations across 9 Tier 1 or 2 continuous beach segments. Monitoring was initiated and conducted on schedule from the start of the monitoring season (1 April) through the end of the season (31 October). Enterococci densities were relatively stable between 2018 and 2019 and comparable to recent years at Elmer's Island, Grand Isle State Park and Holly Beach, greater at Constance Beach Complex and Cypremort Point State Park in 2019 than in 2018 but comparable to recent years, and considerably greater at Fontainebleau State Park, Grand Isle Beach, Lake Charles North Beach, and Rutherford Beach in 2019 than in 2018 and in recent years. The higher enterococci densities in 2019 were likely influenced by very low salinity during 2019 at all beaches. Lower salinity during 2019 can be explained by the extremely high discharge of fresh water from the Mississippi River throughout the monitoring season, with 2019 having the highest average discharge during the monitoring season since Program inception.

Fifty-eight (58) advisories and 0 closures were issued during the 2019 swim season. Advisories were issued at all Tier 1 or 2 sample stations during 2019 based on observed water quality exceedances. Compliance at stations varied between 96% of monitored days in compliance at GIB2, to a low of 40% for LCNB. Compliance at stations varied between 96% of monitored days in compliance at GIB2 and HOLLY5, to a low of 4% for FNTB1. Across all monitored sample stations, 63% (2,648 of 4,209) of the 2019 swimming season's available station-days (monitored station-days not under closure) were in compliance and not under an advisory.

Beach advisories issued in 2019 resulted from exceedances of enterococci geometric mean or single sample maximum criteria (in compliance if enterococci geometric mean  $\leq$  35 MPN/100

ml and sample enterococci density  $\leq 104$  MPN/100 ml). The enterococci GM was exceeded in 228 of 245 (93%) observed noncompliance station-weeks, with 162 (66%) of those noncompliance weeks resulting from enterococci geometric mean exceedances only, 66 (27%) resulting from both enterococci geometric mean and single sample maximum exceedances, and 17 (7%) resulted from exceedance of enterococci single sample maximum criterion alone.

As discussed in previous Louisiana BEACH Grant reports, Louisiana's percentage of station-weeks that were under advisory is not directly comparable with other states that do not use equivalent beach advisory criteria. Louisiana would have issued only 34% of its 2019 advisories if the State's decision rule was based only on the enterococci single sample maximum criterion ( $\leq 104$  CFU/100mL). If Louisiana had used the Beach Action Value (BAV) criterion of 60 CFU/100mL<sup>1</sup> during 2019 in lieu of its current criteria, 79% of the weekly advisory decisions would be unchanged, 16% of station-weeks placed under advisory for exceedance of Louisiana's criteria would be deemed in compliance, and 5% of 2019 station-weeks exceeded the BAV criteria but were in compliance with Louisiana's beach advisory criteria. Accordingly, Louisiana's beach advisory criteria are comparable to slightly more protective of public health than the BAV criterion.

Based on year-end audit and data review, all completeness goals were achieved, and there were no variances from the QAPP detected. Of the 766 samples successfully processed, all results were considered valid and recorded in the Program's database. All monitoring and notification data collected during 2019 have been uploaded to the appropriate USEPA data storage systems (available through EPA's Water Quality Portal [<https://www.waterqualitydata.us/>] and BEACON [<http://watersgeo.epa.gov/beacon2/about.html>]).

In preparation for the 2020 Beach monitoring season, the Program reassessed risk levels at monitored beaches to determine whether additional beaches warranted monitoring. Risk is a function of historical water quality conditions based on past Program sampling and beach use. Based on observed use levels and patterns during the 2019 swimming season and projections of use for the 2020 swimming season, it is anticipated that use levels and patterns will remain at approximately historical levels for all beaches except South Beach. Public access to South Beach is expected to remain restricted for the foreseeable future, and thus is proposed for "historical" beach designation. Historical designation means that those beaches will not be monitored unless public access is restored in the future. No additional beach segments were identified that warranted monitoring in 2020.

The anticipated use and historical water quality risk levels resulted in the 2020 monitoring season classification of six continuous beach segments as Tier 1 beaches (Fontainebleau state Park, Elmer's Island [ELMR], Grand Isle and Cypremort Point State Parks, Holly [HOLLY], and North Beach), three beach segments as Tier 2 (Grand Isle Beach, the Constance Beach Complex, and Rutherford Beach), and one Tier 4 beach segment (Elmer's Island East). In 2020, it is anticipated that the Program will monitor approximately 6 beach miles as Tier 1 beaches, approximately 14 miles as Tier 2 beaches, and 0 miles of Tier 3 and 4 beaches.

---

<sup>1</sup> As recommended in *National Beach Guidance and Required Performance Criteria for Grants*, EPA-820-D-13-001, dated April 18, 2014.

## CHAPTER 1. Purpose, Background and 2019 Program Accomplishments

### Purpose

According to *Louisiana’s BEACH Grant Final Report – Grant Year 2001* (the Beach Report; LDHH 2003) and *Louisiana’s Beach Program Quality Assurance Project Plan* (QAPP; LDH 2019), the Louisiana Department of Health (LDH; formerly known as Louisiana Department of Health and Hospitals [LDHH]), Office of Public Health (OPH), Center for Environmental Health Services (CEHS) is to submit an annual technical report to U.S. Environmental Protection Agency (USEPA) after the end of the recreational period. The report should accomplish the following: summarize the number of beaches monitored in each Tier, list any additional beaches to be added to the Program or Tier reassignments to be made in the coming year, provide a compilation of the sampling results, and summarize beach assessment activities and response actions. This report serves as the annual technical report for the 2019 recreational period and satisfies all the requirements described above.

This document consists of four chapters. In this chapter, 2019 Program accomplishments are summarized. Chapter 2 contains a summary of the number of beaches that were monitored in each Tier, and a description of updates to Louisiana’s BEACH Program, as anticipated under the Beach Report. Louisiana’s BEACH Program updates include descriptions of 2019 Program modifications and changes to Tier assignments and beaches to be monitored under the Program in 2020. In Chapter 3, monitoring and response efforts and results for 2019 are provided. Data quality assessment results for the 2019 swimming season are presented in Chapter 4. Appendices A, B, and C contain station names and USEPA IDs, time series analyses of water quality data, and sample results, respectively. Appendix D provides a summary of how Louisiana’s BEACH Program has fulfilled the original BEACH Grant requirements.

### Background

In many ways, water could be considered Louisiana’s greatest natural resource. Louisiana’s vast estuarine basins provide a unique playground for swimming, wading, boating, fishing, and other aquatic activities. However, swimming in waters with high bacteria densities from fecal sources are a known threat to public health, causing elevated rates of gastrointestinal illness. Louisiana Department of Environmental Quality (LDEQ) has historically conducted routine ambient monitoring of state coastal waters designated for primary contact recreation and utilized fecal coliform criteria to assess attainment of ambient water quality standards for swimming uses. However, there were no mechanisms in place to routinely sample water quality at “high-use” swimming waters, which had not been designated in state regulations by LDEQ, or to provide the public with the results of risk-based analyses that allow for an informed decision prior to swimming in selected coastal recreation waters.

In response to growing concern about public health risks posed by polluted bathing beaches, the U.S. Congress passed the BEACH Act in 2000. In 2001, the USEPA, under the provisions of the BEACH Act, made grant funds available to the OPH for the development of a monitoring and notification program for high-use coastal recreation sites, referred to as Louisiana’s BEACH

Program. Since initial grants were awarded, Louisiana’s BEACH Program has been developed and successfully implemented under the guidance of the CEHS.

Consistent with USEPA’s guidance, Louisiana’s BEACH Program consists of two primary activities: monitoring and notification. Since bacteriological contaminants cannot be effectively monitored directly, monitoring for fecal contamination of surface waters requires the identification of indicator organisms that are associated with fecal contamination and readily monitored using available technologies. Like most other states, Louisiana historically used fecal coliform densities as the indicator of bacteriological contamination of surface waters. However, under the terms of BEACH grant awards, states must base decisions about marine water quality at sites monitored using BEACH grant funds on enterococci bacteria densities. Enterococci have recently become generally accepted by the scientific community as more closely associated with rates of gastrointestinal illness in marine environments than fecal coliform densities, and thus USEPA believes that the use of enterococci may serve to better protect the public health in marine environments.

The second primary activity under the Program is public notification. Louisiana’s BEACH Program issues public health advisories at Tier 1 and 2 monitored sites (tiers are defined in Chapter 2) when water quality samples are found to exceed the beach advisory enterococci criteria. The beach advisory enterococci criteria used are a single sample maximum of  $\leq 104$  and a steady state maximum based on a 30-day running geometric mean of  $\leq 35$  (quantities expressed as MPN/100 ml). Advisories urge users to abstain from swimming, but do not officially “close” the water body to recreational use. The Program disseminates swim advisories by website postings, and by opening pole-mounted signs which are installed at the beach monitoring sites. When water quality sample results indicate that bacteria levels at beach sites under swim advisories are once again compliant with the decision rule, the public is notified that the advisory has been lifted through beach signage and the website (<http://www.dhh.louisiana.gov/index.cfm/page/288>).

### 2019 Program Accomplishments

During 2019, Louisiana’s BEACH Program:

1. Monitored all accessible sample sites designated for monitoring in accordance with the requirements of their tier assignment throughout the swimming season; and
2. Continued to meet or exceed the quality assurance/quality control goals established in the Program’s QAPP (LDH 2019).

## **CHAPTER 2 - Update of BEACH Program**

### Review of Beach Rankings

In 2003, the CEHS completed a systematic process to identify and rank Louisiana's beaches according to risk. The process consisted of the following steps (LDHH 2003):

1. Identification and definition of coastal recreation waters;
2. Identification of beaches or similar points of access used by the public for swimming, bathing, surfing, or similar water contact activities;
3. Review of available information on levels of potential fecal contamination at beaches and intensity of beach use; and
4. Ranking of beaches to decide which beaches would be included in Louisiana's BEACH Program.

Based on levels of beach use and perceptions of water quality from estimated fecal coliform densities in adjacent waters, a qualitative ranking scheme was devised and used to assign each beach to an appropriate monitoring tier. The monitoring tiers provide levels of monitoring and public notification such that beaches with a greater density of swimmers, and thus a greater number of people at risk, receive a higher intensity of monitoring and public notification than lower use beaches. Monitoring and public notification procedures are the same at Tier 1 and Tier 2 beaches but differ in density of sample stations. Sample stations are closer together at Tier 1 beaches, no more than 500 meters apart, than at Tier 2 beaches, where sample stations are no more than 2 miles apart on continuous beach segments. Sample stations at Tier 3 and 4 beaches are at the same density as Tier 2 beaches, but samples are not collected weekly, and accordingly, weekly public advisories are not issued for Tier 3 and 4 beaches. Tier 4 beaches meet the same criteria specified for Tier 3 beaches, which are described below, but due to very limited primary contact recreation use and historically good water quality, are not monitored.

The initial assignments of beach segments to monitoring Tiers was completed in 2003 (LDHH 2003). The estimated number of swimmers at each beach was based on information obtained primarily from law enforcement officials responsible for patrolling the beach and from park managers. The officials provided estimates of the number of beach visitors on a typical weekday, weekend, and holiday during the peak swimming season, May 1 through Labor Day, along with an estimate of the percentage of beach users entering the water. These estimates were combined by adding typical weekday and weekend use to provide an estimate of weekly use. Weekly use was multiplied by the number of weeks in the recreational period and added to the estimated number of holiday visitors during Memorial Day, Fourth of July, Labor Day, and any other beach-specific major events. Because the resulting total was an estimate of unknown precision, those estimates were generalized into broad categories of use for relative comparison as follows:

Category of Use	Estimated Number of Swimmers
Very Low	<5,000
Low	5,000 to <10,000
Moderate	10,000 to <15,000
High	15,000 to 20,000
Very High	>20,000

Because beach water quality was either inferred from the water quality of the surrounding area as a whole, or based on a short period of data, and no studies were available providing a model of the relationship between fecal coliform concentrations and illness rates, the qualitative ranking process relied primarily on beach use. Beaches classified as having very high, high, or moderate to high use were assigned to Tier 1 and receive the most monitoring attention. Beaches classified as having moderate use were assigned to Tier 2. Beaches with low or very low use were assigned to Tier 3 and targeted for additional bacterial indicator monitoring to better characterize risk. Beaches on private land or with existing swimming advisories posted by the State, and with very low public use were excluded from further consideration. A total of 29.16 miles of beach were considered for monitoring under Louisiana’s BEACH Program, of which 23 miles were assigned to a monitoring tier (LDHH 2003).

CEHS anticipated that beach use and water quality could change through time and planned to re-evaluate beach rankings on an annual basis at the end of each swimming season (LDHH 2003). In 2006, it was decided that the Program would continue to evaluate risk primarily on the estimated density of swimmers at a beach in accordance with the original categories of use described above, but a new method of assessing water quality risk was developed. The original assessment evaluated water quality based on estimated fecal coliform densities, which was the only beach specific indicator organism data available at the time. Data collected during 2004 and 2005 provided new information about water quality, including enterococci densities, which were not previously available. Because USEPA’s chosen indicator organism for marine waters is enterococci, and because greater than 99.8% of all of Louisiana’s swim advisories issued through 2005 involved exceedance of beach advisory enterococci criteria, new water quality categories based on enterococci densities were developed for use in the risk-based Tier assignment process (LDHH 2006).

A sample station’s annual enterococci geometric mean density was strongly correlated with the percentage of monitored weeks under advisory, so a sample station’s geometric mean is a good indicator of the likelihood of exceeding the established limits of acceptable risk. Accordingly, water quality risk categories were based on the ratio of a beach’s annual enterococci geometric mean to the enterococci geometric mean decision criterion of 35 MPN/100 ml. Water quality risk categories were established as: “Lower Risk” if the beach’s annual geometric mean/35 < 0.5; “Moderate Risk” if the beach’s annual geometric mean/35  $\geq$  0.5 and < 1; and “Higher Risk” if the beach’s annual geometric mean/35  $\geq$  1. Using the revised classification scheme, continuous beach segments were assigned to Tiers at the beginning of 2019. Table 1 identifies the beaches that were monitored under the Program during 2019, their designated 2019 monitoring Tier, and associated sample stations. Beach use during 2019 approximated historical levels except for

South Beach (LCSB1), which remained closed to the public in 2019 due to bank stabilization construction.

**Table 1.** Continuous beach segments, beach miles, monitoring Tier assignments for 2019 and 2020, and sample stations.

Continuous Beach Segments	Designated Beach Miles	First Year Sampled	2019 Designated Monitoring Tier <sup>2</sup>	2019 Actual Monitoring Tier <sup>2</sup>	2020 Designated Monitoring Tier <sup>2</sup>	Sample Station State IDs <sup>1</sup>

Note: <sup>1</sup> Sample station names and USEPA IDs are provided in Appendix A.; <sup>2</sup> Tier assignments based on risk categorization; Tier 4 indicates a tier 3 beach that is used by the public and is not monitored; H indicates a beach segment that is not open to the public and therefore not monitored, and will be proposed for “historical” designation.

During 2019, six continuous beach segments were designated as Tier 1 beaches and scheduled for monitoring (Grand Isle, Cypremort Point, and Fontainebleau State Parks; Elmer’s Island, Holly Beach, and North Beach in Lake Charles), and three continuous beach segments were designated as Tier 2 (Grand Isle Beach, Rutherford Beach, and the Constance Beach Complex). All beach segments were monitored at their designated tiers during 2019. South Beach has been designated as a historical beach due to continued closure to the public through 2019 for bank stabilization construction and anticipated continued closure to swimming into the foreseeable future. Vertical metal sheet piling was used to stabilize the eroding bank, which eliminated the beach and inhibits direct water access by bathers. Elmer’s Island East (ELMR2) was assigned to

Tier 4 for the 2019 swim season due to very low usage and lower risk water quality in accordance with EPA guidance (the beach is used by the public but not monitored).

In summary, during 2019, the Program monitored all six continuous Tier 1 beach segments (approximately 6 beach miles), including sampling and public notification at all 14 of the Tier 1 sample stations (Table 2). Three Tier 2 continuous beach segments totaling approximately 14 miles were also monitored during 2019, including sampling and public notification at 9 sample stations. One Tier 4 sample station on Elmer’s Island East (ELMR2) was not scheduled to be monitored during 2019.

**Table 2.** Number of continuous beach segments, sample stations, and beach miles monitored by Tier during 2019 and planned for 2020.

Tier	2019 (Actual)				2020 (Projected)			
	1	2	3	4	1	2	3	4
Number of Continuous Beach Segments	6	3	0	1	6	3	0	1
Number of Sample Stations	14	9	0	1	14	9	0	1
Total Beach Miles	6	14	0	2	6	14	0	2
Number of Continuous Beach Segments Monitored	6	3	0	0	6	3	0	0
Number of Sample Stations Monitored	14	9	0	0	14	9	0	0
Total Beach Miles Monitored	6	14	0	0	6	14	0	0

In anticipation of the 2020 swimming season, as in past years, monitoring tier assignments were reviewed for all beaches based on expected use levels and historical water quality. It is anticipated that use levels and patterns will remain at approximately historical levels for all beaches except for South Beach. Public access to South Beach is expected to remain restricted for the foreseeable future, and thus is proposed for “historical” beach designation. Historical designation means that those beaches will not be monitored unless public access is restored in the future.

Using water quality data pooled across sample stations within continuous beach segments, water quality risk categories were calculated for each continuous beach segment for use in establishing 2020 Tier assignments (Table 3). Two systems of beach water quality assessment were used, the Louisiana BEACH Program’s beach risk classification, as described above, and the World Health Organization’s (WHO) risk categorization system. The WHO’s microbial water quality assessment criterion (WHO 2003) was applied to the last three years (2017–2019) of Louisiana’s water quality data. In addition to water quality, the WHO classification system uses sanitary inspection categories to classify waters from very good to very poor, depending on the beach’s susceptibility to fecal influence as determined by a sanitary survey, but only the microbial criterion was evaluated for the purposes of this report. Rather than rely on the annual enterococci geometric mean for its microbial criterion, the WHO uses the parametric 95<sup>th</sup> percentile of observed enterococci densities over a longer-term period, typically a minimum of three years. The WHO selected the 95<sup>th</sup> percentile because it is easily understood and reflects much of the top-end variability in the distribution of water quality data that are of greatest public

health concern and is robust against periodic variation in water quality. The WHO classifies water quality into four categories based on enterococci density (cfu/100 ml) and the associated risk of acquiring gastrointestinal illness as follows: A) <1 case in 100 exposures, 95<sup>th</sup> percentile ≤40 cfu/100 ml; B) between 1 and 5 cases in 100 exposures, 95<sup>th</sup> percentile 41-200 cfu/100 ml; C) between 5 and 10 cases in 100 exposures, 95<sup>th</sup> percentile 201-500 cfu/100 ml; and D) >10 cases in 100 exposures, 95<sup>th</sup> percentile >500 cfu/100 ml. For comparison, the USEPA’s gastrointestinal illness rate associated with the 1986 recommended beach advisory enterococci criteria for marine recreational waters is 19 illnesses per 1,000 swimmers and the 2012 recommended enterococci criteria is 32-36 gastrointestinal illnesses per 1,000 swimmers, both of which falls within WHO category B. To facilitate comparison with Louisiana’s risk categories, we have categorized WHO classes A and B as lower risk, C as moderate, and D as higher risk.

**Table 3.** Beach water quality and use risk categories for 2020 swimming season based on anticipated use in 2020 and 2019 water quality data.

<b>Beach</b>	<b>Anticipated 2020 Use</b>	<b>2019 Entero. Geometric Mean</b>	<b>2019 Entero. Geometric Mean / 35</b>	<b>2019 Water Quality Risk Cat.</b>	<b>Entero. 95<sup>th</sup> Parametric Percentile 2017-2019</b>	<b>WHO Risk Category<sup>1</sup></b>

LCNB	Very High	83.5	239%	Higher	696	D
RUTH	Very Low	50.7	145%	Higher	347	C

Note: <sup>1</sup> WHO risk categorization based on 2017-19 water quality data due to the requirement for a three-year evaluation term (risk categories previously defined in body of the report).

Water quality calculated using the Louisiana and the WHO risk categorization systems generally agreed. However, differences between the two categorization schemes can result from using different time periods (Louisiana’s risk categorization uses only the prior year, where the WHO uses three prior years), and metrics (geometric mean versus 95<sup>th</sup> percentile). Using the modified WHO risk categorization results, five continuous beach segments were classified in the lower water quality risk category (Constance Beach Complex, Elmer’s Island, Grand Isle beaches, Grand Isle State Park, and Holly Beach), two in the moderate risk category (Cypremort Point State Park and Rutherford Beach) and two in the higher risk category (Fontainebleau State Park and North Beach in Lake Charles). In contrast with the modified WHO categorization, Louisiana’s risk categorization resulted in no continuous beach segments classified in the lower water quality risk category, five in the moderate risk category (Constance Beach Complex, Elmer’s Island, Grand Isle beaches, Grand Isle State Park, and Holly Beach) and four in the higher risk category (Cypremort Point and Fontainebleau State Parks, and North Beach in Lake Charles, and Rutherford Beach).

The Louisiana BEACH Program’s beach risk classification was selected for use in assigning beaches to tiers. Combined 2020 anticipated use and 2019 water quality rankings for each continuous beach segment are given in Table 4. As discussed above, tier categories remain based on the same swimmer density categories that were used in the original tier designation system, but low and very low use categories are designated as “Discretionary.” For “Discretionary” beach segments, the Louisiana BEACH Program Manager will decide if Tier 2, 3 or 4 level monitoring is warranted at any time during the monitoring season. Because of the very low to low use at Constance Beach Complex and Rutherford Beach, it is anticipated that they will remain Tier 2 beaches during 2020. The 2019 beach tier assignments are expected to remain in place for 2020 as shown in Table 1. Elmer’s Island East (ELMR2) will not be monitored during 2020 due to continued very-low use and lower-risk water quality and is designated as a Tier 4 beach. Therefore, the Program is expected to monitor all Tier 1 beaches totaling 5.8 beach miles, all Tier 2 beaches totaling 14 miles, and 0 of approximately 1.9 Tier 4 beach miles (Table 2) in 2020.

**Table 4.** Combined beach use and water quality risk categories for 2020.

		Water Quality Risk <sup>1</sup> =>				
		Lower Risk	Moderate Risk	Higher Risk	Unknown	
# of Swimmers =	VH	GISP		LCNB		Tier 1
	H	ELMR1, HOLLY		CYPT, FNTB,		
	M	GIB				Tier 2
	L	CNSTBC <sup>2</sup>				Tier3
	VL	ELMR2 <sup>3</sup>		RUTH <sup>4</sup>		
		<b>Discretionary</b>				

Notes: <sup>1</sup>Water quality risk level based on 2019 data using Louisiana’s risk classification. <sup>2</sup>CNSTBC will be monitored as tier 2 during 2020. <sup>3</sup>ELMER2 is classified as a Tier 4 beach for 2020 because very low use and Lower Risk water quality and will not be monitored in 2020. <sup>4</sup>RUTH will be monitored as a tier 2 beach during 2020.

In addition to annually re-evaluating risk levels and associated tier designations for beach segments monitored during the previous year, the program determines if any additional beaches warrant monitoring. No additional beaches were identified for inclusion under the Program.

Program Modifications

Due to continued restricted public access to South Beach in Lake Charles, the beach is proposed for “historical” beach designation and elimination from Louisiana’s BEACH program. South Beach, along with other historical beaches, will be re-evaluated annually to determine if public access has been restored. No other modifications were made to the Program’s procedures, methods or decision rule during 2019. The Program followed the procedures, methods and decision rule summarized in *Louisiana’s BEACH Program Quality Assurance Project Plan*, which is available on the World Wide Web at <http://www.dhh.louisiana.gov/index.cfm/page/288>.

### CHAPTER 3. Louisiana BEACH Program’s 2019 Results

#### Number of Samples Collected

Between 1 April 2019 and 31 October 2019, a total of 766 samples were collected at 23 sample stations (see Table 5), distributed among four sample types: field duplicates and splits, resample, and routine samples. Each type of sampling is described below.

**Table 5.** Total number of samples collected by sample station and sample type during 2019 by Louisiana’s BEACH Program.

Sample Station	Sample Type				Station Total
	Field Duplicate	Field Split	Resample	Routine	
CNST1	0	2	0	30	32

RUTH1	0	3	0	30	33
<b>Sample Type Total</b>	<b>35</b>	<b>42</b>	<b>0</b>	<b>689</b>	<b>766</b>

Routine samples are the regularly scheduled weekly samples collected during the designated monitoring period at beaches that are officially part of the Program. A total of 689 routine

samples were collected across 23 sample locations monitored during 2019. Resamples are collected at the BEACH Program Manager’s discretion when a routine sample has an unexpectedly high indicator organism density or when the source of an exceedance is known and has been corrected and extra samples are required to calculate a post-event geometric mean. There were no resamples collected during 2019.

Field duplicates and field splits are two types of quality control (QC) samples. Field duplicates were used to estimate the precision of sampling methods by comparing laboratory results for two samples taken consecutively on the same day at the same sampling site (i.e., one grab is considered the routine sample or resample and the other the QC sample). Field splits were used to estimate the precision of laboratory analyses (intra-laboratory) plus any variability induced during sample handling and transport by analyzing two aliquots of the same water sample (i.e., one-half of the split sample is considered the routine sample or resample and the other half the QC sample), which were subdivided in the field. Louisiana’s BEACH Program QAPP requires that approximately 10% of scheduled sample events be designated as quality control samples, which are selected at random at the beginning of the sampling period in approximately equal proportions ( $\approx 5\%$  each) of field duplicate and field split samples. QC samples may also be collected during resample events to improve the precision of estimated indicator organism densities by averaging resample and QC sample results. A total of 78 QC samples were scheduled to be collected concurrent with the 713 routine samples and were to consist of 35 field duplicates and 43 field split samples. Of the 713 scheduled routine samples, 689 were collected (97%), with 23 samples (one sample for all beaches) cancelled in mid-July due to Hurricane Barry, and sampling at 1 station (FNTB1) missed in September due to limited personnel availability. For the station-weeks with sample results, 77 QC samples were scheduled (35 field duplicates and 42 field split samples). A total of 35 field duplicates and 42 field split samples were collected during 2019. Thirty-four (34) field duplicates were sampled as scheduled (97%), and 40 field split samples were collected as scheduled (95%), resulting in 96% of QC samples collected as scheduled. One field split sample was missed when scheduled but a replacement field split samples taken, and one field duplicate and 1 field split were reversed (a FS was taken when a FD was scheduled and the reverse). Accordingly, the QC sample goal was achieved with 100% of the required QC samples collected.

Of the 766 total samples, all were collected during the designated monitoring period, and those collected at Tier 1 and 2 beaches were used to make weekly water quality decisions. For analysis purposes, samples collected on the same date at the same location were not considered independent, and were averaged together (i.e., arithmetic mean) resulting in a total of 689 independent samples collected during the 2019 designated monitoring season (see Table 6).

#### Summary Statistics for 2019 Designated Monitoring Period Samples

Results of enterococci density (MPN/100ml) and salinity (parts-per-thousand; ppt) for each sample location during the 2019 designated monitoring period are summarized in Table 7 and depicted graphically in Figures 1 and 2. Because indicator organism densities are lognormal distributed, Table 7 presents  $\log_e$  mean and  $\log_e$  standard deviations; exponentiation of the  $\log_e$  mean produces the geometric mean on the nominal scale. Note that the  $\log_e$  enterococci median

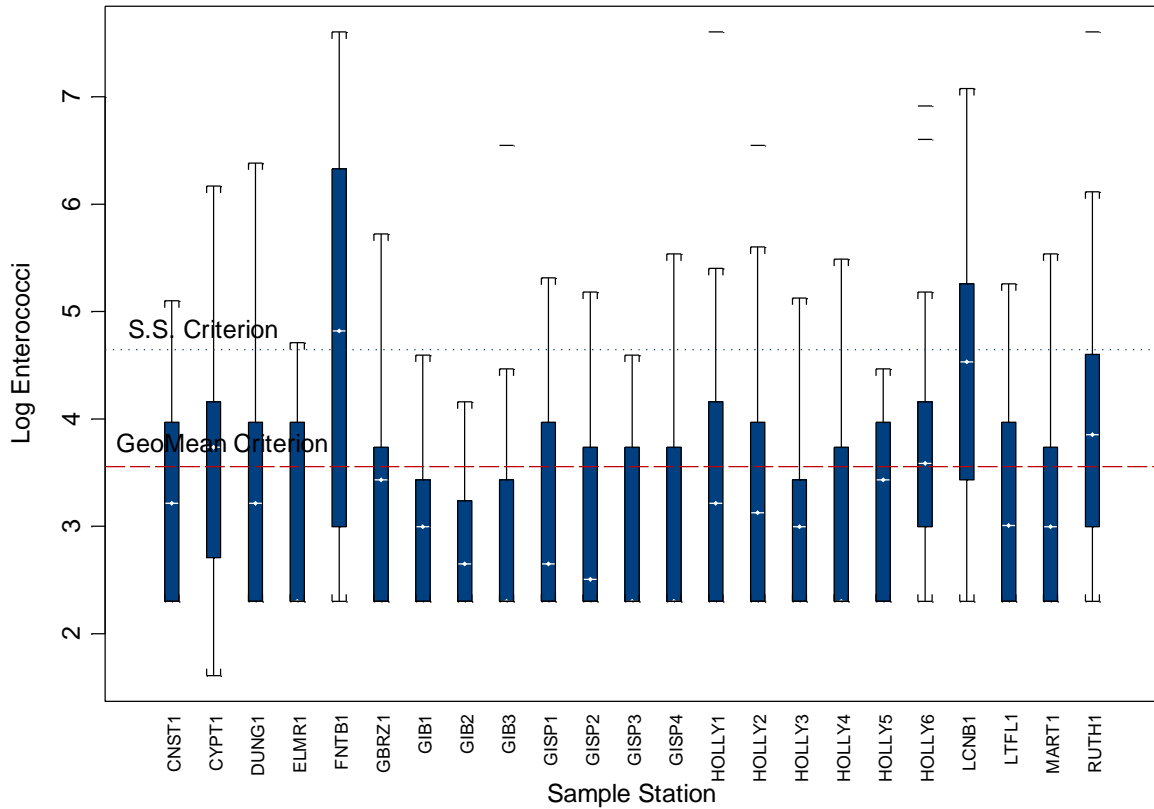

shown in the graph and  $\log_e$  mean in Table 7 are approximately equal as would be expected for lognormal distributed populations.

**Table 6.** Number of independent samples collected by sample station during the 2019 monitoring season (1 April – 31 October). Samples collected at the same station on the same day are counted as a single sample.

**Figure 1.** The distribution of  $\log_e$  transformed enterococci densities (MPN/100ml) by sample station relative to the geometric mean (GeoMean) and single sample (S.S.) maximum criteria for samples collected during the 2019 designated monitoring season. The box represents the inner quartile range (25<sup>th</sup> to 75<sup>th</sup> percentiles), and upper and lower whiskers extending from the box represent the smallest and largest observations within one step (1.5 times inner quartile range). The median ( $\diamond$ ) is marked by a line through the box, and horizontal bars (—) represent extreme values.

**Figure 2.** The distribution of salinity (ppt) by sample station for samples collected during the 2019 designated monitoring season.

Time-Series of 2019 Designated Monitoring Period Samples

In addition to calculating summary statistics for each sample station over the 2019 designated monitoring period, results are presented as a time-series (Appendix B, Figures B.1 through B.23; data for each sample event is provided in Appendix C). Because sample results were used during the designated monitoring season to make weekly determinations of whether water quality at each sample station met the Program’s beach advisory criteria for Tier 1 and 2 beaches, sample results and the running 30-day geometric mean are shown in the figures. In each week, the last enterococci sample of the week and the running 30-day geometric mean for enterococci must both be less than or equal to their respective criterion for the sample station to be classified as in compliance. If either criterion was exceeded, the sample station was classified as not in compliance and a swimming advisory was issued. The advisory remained in effect until the most recent sample results and the running geometric means were all less than or equal to their respective criterion.

### Weekly Decision Rule Outcomes

During the 2019 swimming season (1 May – 31 October), 23 sample stations were monitored at ten Tier 1 or 2 continuous beach segments with a total of 58 advisories and 0 closures issued. Advisories were issued at all Tier 1 or 2 sample stations during 2019 based on observed exceedances of enterococci geometric mean and single sample maximum criteria (see Tables 8 and 9). Compliance at stations monitored throughout the swimming season varied between 96% of monitored days in compliance at GIB2 and HOLLY5, to a low of 4% for FNTB1. Across all monitored sample stations, 63% (2,648 of 4,209) of the 2019 swimming season's available station-days (monitored station-days not under closure) were in compliance and not under an advisory.

Most 2019 advisories were issued due to exceedances of the enterococci geometric mean criterion (Table 10). The enterococci GM was exceeded in 228 of 245 (93%) observed noncompliance station-weeks, with 162 (66%) of those noncompliance weeks resulting from enterococci geometric mean exceedances only, 66 (27%) resulting from both enterococci geometric mean and single sample maximum exceedances, and 17 (7%) resulted from exceedance of enterococci single sample maximum criterion alone.

As discussed in previous Louisiana BEACH Grant reports, Louisiana's percentage of station-weeks that were under advisory is not directly comparable with other states that do not use equivalent beach advisory criteria. Using only the single sample maximum criterion ( $\leq 104$  CFU/100mL), as some states have, Louisiana would have issued only 34% of its 2019 advisories. Applying the Beach Action Value (BAV) criterion of 60 CFU/100mL<sup>2</sup> to Louisiana's 2019 monitoring results, 79% of the weekly advisory decisions would be unchanged, 16% of station-weeks placed under advisory for exceedance of Louisiana's criteria would be deemed in compliance, and 5% of 2019 station-weeks exceeded the BAV criteria but were in compliance with Louisiana's beach advisory criteria.

When exceedances of beach advisory criteria were detected, an advisory was issued. To notify the public that a swimming advisory was in effect, the BEACH Program's monitoring/advisory sign at the sample site was opened and a notice of the advisory was placed on the OPH BEACH website (<http://www.dhh.louisiana.gov/index.cfm/page/288>).

---

<sup>2</sup> As recommended in *National Beach Guidance and Required Performance Criteria for Grants*, EPA-820-D-13-001, dated April 18, 2014.

Relationship between Indicator Organisms and Environmental Conditions

With each water sample collected by the BEACH Program, environmental variables were also collected, including surface water temperature (°F), salinity (ppt), tide conditions, weather conditions, and wind direction and speed. Total precipitation (in.) 0–24 hrs (precip0), 24–48 hrs (preciplag1), 48–72 hrs (preciplag2), and 72–96 hrs (preciplag3) prior to sample collection were estimated using rain basin precipitation values taken from Louisiana’s Molluscan Shellfish database. Rain basin daily precipitation was estimated by averaging observed precipitation at

rain gauges within the rain basin, and beaches were assigned to the rain basin in which they occurred. The number of days between sample collection and the most recent prior day with a precipitation record > 0 (DaysSinceLastRain) was estimated, and daily precipitation estimates were summed into measures of total precipitation within 0–48 hrs (precip48) and 0–72 hrs (precip72) prior to sample collection (these data are available upon request).

Using the observed environmental variables, estimated precipitation values and the associated  $\log_e$  transformed enterococci densities collected by the Program from 2004 through 2009, CEHS performed a thorough statistical analysis to determine how indicator organism density was influenced by environmental factors at Louisiana’s coastal beaches (the 2009 analysis). The results of the 2009 analysis confirmed the findings of previous reported analyses that there were no statistically meaningful differences among sample stations within continuous beach segments (StateID explains almost none of the variation in enterococci density), and that enterococci densities had changed from year to year (Year) at all beach segments except Fourchon, which had remained stable. The complete results of the 2009 analysis were reported in the *Louisiana BEACH Grant Report, 2009 Swimming Season*, which concluded that:

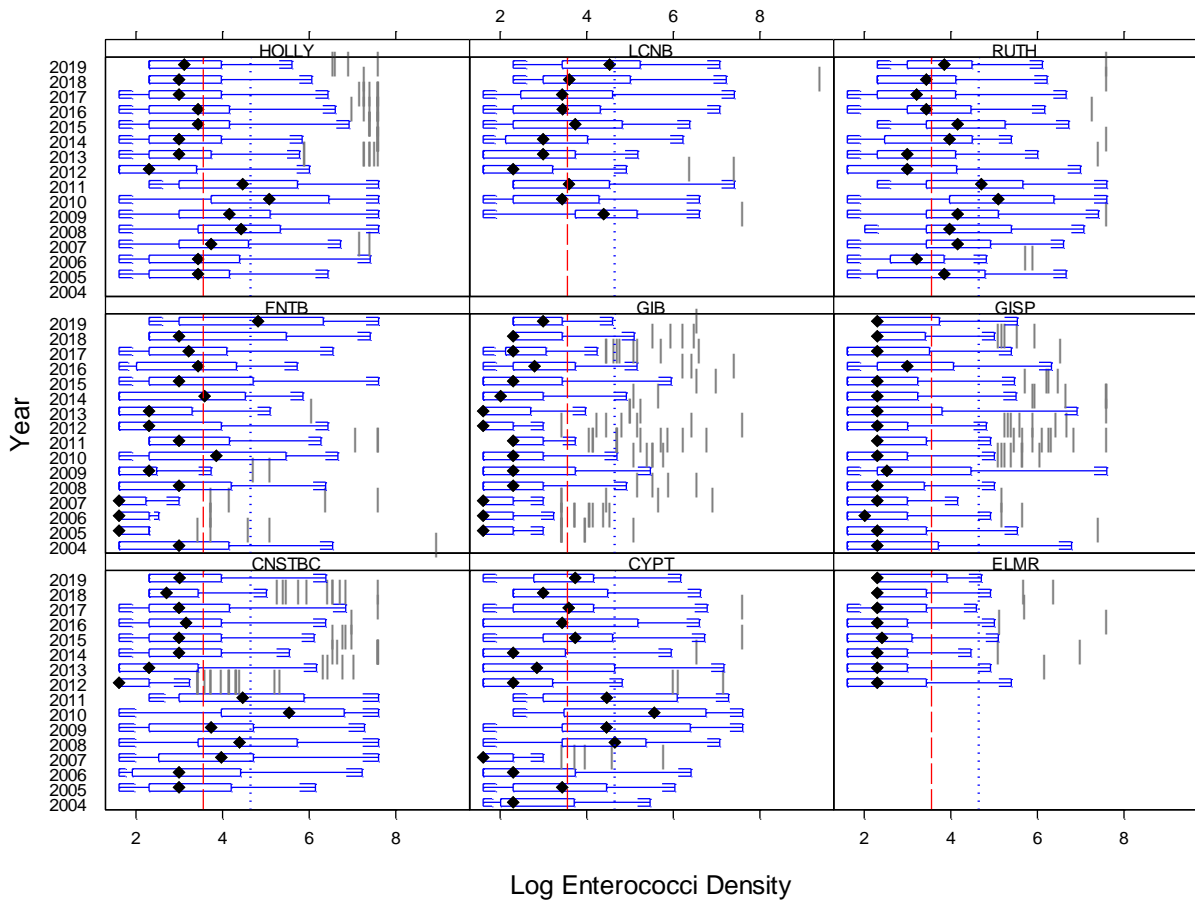

“given the available data, it is unlikely that models that can reliably predict enterococci densities can be developed for Louisiana’s beaches. Different environmental factors are most correlated with enterococci density for different beach segments and area groups, and no single environmental factor is useful in predicting indicator organism density. It also appears that the relationship between environmental factors and enterococci density is complex and will take more investigation to understand, requiring targeted studies that are not funded under current Beach Grants. Better measurement of the environmental variables that are currently being collected and/or collection of additional environmental measures may be required to adequately predict water quality from observable environmental conditions. Louisiana beaches are somewhat different from those of most coastal states in that they represent a wide range of salinity conditions and most are relatively remote from urban runoff, reducing the direct association between environmental conditions and enterococci densities.”

Through 2011, a total of 5,164 independent<sup>3</sup> samples were collected; 1,555 samples beyond those available in 2009. Given the additional data available, the analysis was repeated and yielded the same conclusions as were drawn following the 2009 analysis. That is, year-to-year differences in enterococci density at all beach segments other than FOUR was a significant source of variation, and that for most beach segments, the relationship between the environmental variables and enterococci density changed from year to year. Additionally, the observed year-to-year variation in enterococci density was not explained by corresponding differences in the environmental variables. Because of large year-to-year differences in enterococci densities and associated annual variance within beach segments, and annual differences in the relationship between enterococci density the environmental variables as shown in the 2011 Annual Beach Report, developing useful statistical models that go beyond describing general patterns of association between environmental conditions and enterococci densities may not be possible for Louisiana’s more remote beaches.

---

<sup>3</sup> For analysis purposes, single samples collected on a date at a sample location were considered independent; multiple samples collected on a date at a sample location were averaged together.

Figure 3 shows the considerable annual variation in enterococci densities within beach segments from Program inception through 2019. Enterococci densities were relatively stable between 2018 and 2019 and comparable to recent years at Elmer’s Island, Grand Isle State Park and Holly Beach, greater at Constance Beach Complex and Cypremort Point State Park in 2019 than in 2018 but comparable to recent years, and considerably greater at Fontainebleau State Park, Grand Isle Beach, Lake Charles North Beach, and Rutherford Beach in 2019 than in 2018 and in recent years. The higher enterococci densities in 2019 were likely influenced by very low salinity during 2019 at all beaches (Figure 4). Lower salinity during 2019 can be explained by the extremely high discharge of fresh water from the Mississippi River throughout the monitoring season, with 2019 having the highest average discharge during the monitoring season since Program inception (based on gauge height at New Orleans; gauge COE-01300).

**Figure 3.** Distribution of  $\log_{10}$  enterococci densities by year within continuous beach segments relative to geometric mean criterion (red dashed lines) and single sample maximum criterion (blue dotted lines).

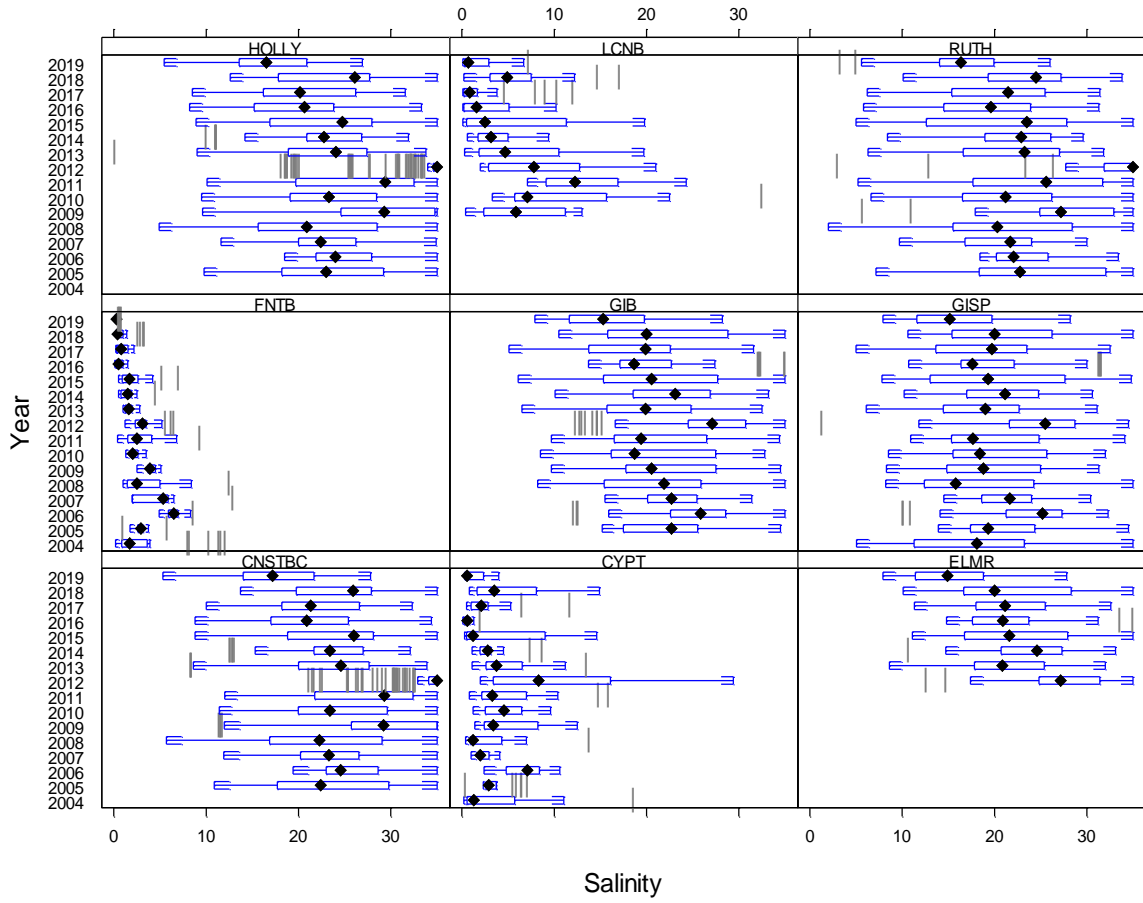

Figure 4. Distribution of salinity (ppt) by year within continuous beach segments.

**CHAPTER 4. Evaluation of Program Performance Relative to Data Quality Objectives.**

*Louisiana’s BEACH Program Quality Assurance Project Plan* (LDH 2019) states that at the end of each year, the Program Manager shall audit the Program to determine if the Program’s data quality objectives are being met. As described in the QAPP (see Table A7.1 of the QAPP), the Program’s data quality objectives for those parameters measured in accordance with the QAPP are expressed in terms of precision and completeness goals. Those data quality objectives are repeated below in Table 11, together with their 2019 results.

**Table 11.** Data quality objectives and 2019 results.

To evaluate compliance with the established data quality objectives (DQOs) for sample and laboratory precision on estimated indicator organism densities and salinity, the results from QC samples, which are always collected in conjunction with a routine sample, calibration sample or resample, were compared to the corresponding sample result. Prior to the start of the monitoring period, approximately 10% of scheduled samples (routine and calibration samples) were designated as quality control samples. QC samples were selected at random at the beginning of the sampling period in approximately equal proportions (~ 5% each) of field duplicate and field split samples. Field splits were designed to estimate the variability of the analysis process, or “lab” precision, plus any minor imprecision resulting from sample handling and transport. Field duplicates were designed to incorporate lab variability plus sampling variability to estimate the variability of collecting another sample at approximately the same place and time. Note that

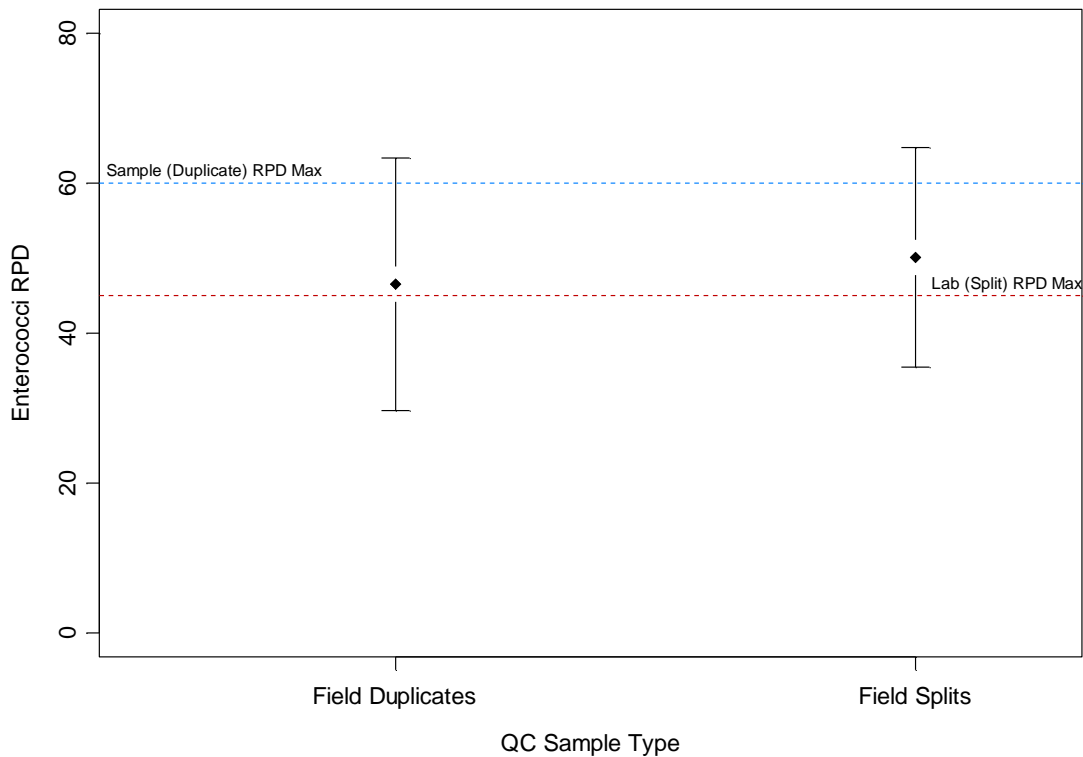

unscheduled QC samples were also collected during some routine sample events, which are also included in the QC evaluation.

Sampling and laboratory precision were estimated from each quality control sample by calculating the relative percent difference (*Sample RPD*) as follows:

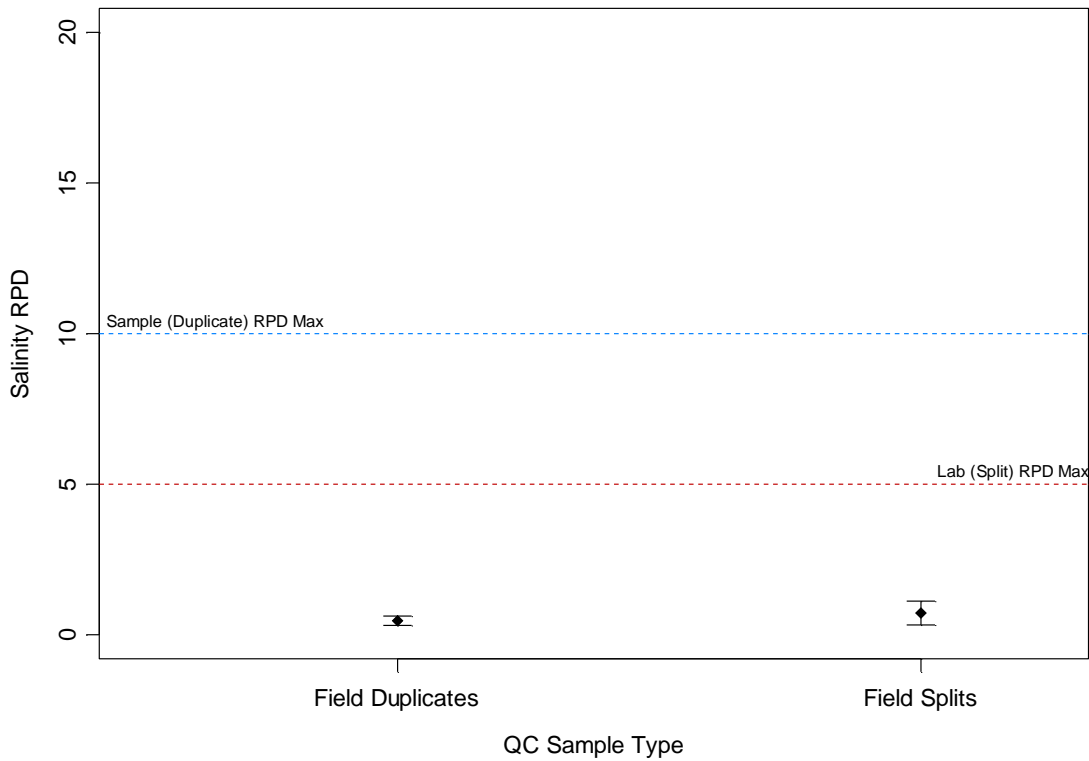

$$\text{Sample RPD} = \frac{|C_1 - C_2|}{(C_1 + C_2)/2} \times 100$$

where  $C_1$  is the routine sample (or calibration or resample) result and  $C_2$  is the quality control sample result. To estimate precision across samples, the mean and standard deviation of Sample RPDs were calculated. Note that the precision goals are expressed as means, and compliance with precision goals is assessed by determining if the observed precision is statistically different from the goal.

As described in Chapter 3, a total of 77 quality control samples were collected during 2019, consisting of 35 field duplicates and 42 field-split samples. To evaluate compliance with QAPP precision goals, means and standard errors of sample RPDs were calculated for the 2019 QC samples and are presented in Table 11. Figures 5-6 show Sample RPD results relative to precision goals; if the lower error bar (lower 95<sup>th</sup> percentile) shown in the graph is below the goal, then the goal has been achieved. All precision goals were achieved for 2019.

**Figure 5.** Comparison of 2019 monitoring season mean enterococci relative percent difference (RPD) for field duplicates and field splits with QAPP precision goals. Means are represented by diamonds and upper and lower 95<sup>th</sup> percentiles of the mean are shown as error bars.

**Figure 6.** Comparison of 2019 monitoring season mean salinity relative percent difference (RPD) for field duplicates and field splits with QAPP precision goals. Means are represented by diamonds and upper and lower 95<sup>th</sup> percentiles of the mean are shown as error bars.

Completeness is the percentage of measurements made that are judged to be valid according to specific criteria and entered into the data management system. Percent completeness (%C) for measurement parameters was estimated as follows:

$$\%C = \frac{V}{T} \times 100$$

where V is the number of measurements judged valid and T is the total number of measurements. During 2019, a total of 766 samples were successfully processed, and all results were considered valid and recorded in the Program’s database.

Based on a thorough review of the data recorded for the 2019 season, all completeness goals were achieved, and there were no variances from the QAPP detected. In addition to the audit and data review described above, the BEACH Program Manager/Quality Assurance Officer verified throughout the 2019 sampling period that:

- All elements of the QAPP were being correctly implemented as prescribed;
- The quality of the data generated by implementation of the QAPP was adequate; and

- Corrective actions, when needed, were implemented in a timely manner and their effectiveness was confirmed.

All beach monitoring and notification data collected during 2019 have been uploaded to USEPA's BEACH (PRAWN) and STORET data systems via submission of an XML formatted file to the Exchange Network Services Center.

**APPENDIX D**

**Summary of Louisiana BEACH Program's  
Fulfillment of U.S. EPA's BEACH Grant Requirements**

**Summary of Louisiana BEACH Program’s  
Fulfillment of USEPA’s BEACH Grant Requirements**

USEPA established nine performance criteria that eligible coastal or Great Lakes state, tribal, or local governments must meet to receive grants to implement coastal recreation water monitoring and public notification programs under the BEACH Act. Those criteria, together with a brief summary of how Louisiana has fulfilled each, are provided below.

<b>Category</b>	<b>Performance Criterion</b>	<b>Louisiana’s Fulfillment of Criterion</b>
<b>Evaluation and Classification</b>	1. Develop risk-based beach evaluation and classification plan	<p>Identification of factors used to evaluate and rank beaches are provided in Chapter 2 of the <i>Louisiana’s BEACH Grant Final Report, Grant Year 2001</i> (the “Initial BEACH Report”; LDHH, 2003). More specifically:</p> <ul style="list-style-type: none"> <li>• Coastal recreation waters are identified in Section 2.1.</li> <li>• Beaches used by the public for water contact activities within coastal recreation waters are identified in Section 2.2.</li> <li>• The original information describing (1) the potential risk to human health presented by pathogens and (2) the use of the beaches is provided in Sections 2.3-2.4 of the Initial Report. Information on the prior year’s water quality and projected level of use for each beach monitored under the Program are provided in Chapter 2 of the Program’s annual report.</li> <li>• EPA is notified annually of any change in beach rankings and other program changes in Chapter 2 of the Program’s annual report.</li> </ul>
<b>Monitoring</b>	2. Develop tiered monitoring plan	<ul style="list-style-type: none"> <li>• Chapter 3 of the Initial BEACH Report describes the Program’s monitoring plan, addressing the frequency and location of beach monitoring, and assessment criteria.</li> <li>• Chapter 2 of the Initial BEACH Report describes periods of recreational use of the waters, and nature and extent of use during certain periods.</li> <li>• Sample stations were established based on spatial use patterns as described in Chapter 2 of the Initial BEACH Report, adjusted for the proximity to known point and nonpoint sources of pollution.</li> <li>• Section 3.1 of the Initial BEACH Report outlines the Program’s quality control plan, which is described more completely in the Program’s current Quality Assurance Project Plan (QAPP).</li> </ul>
	3. Monitoring report submission and delegation	<p>The Program reports monitoring data to the public, EPA, and other agencies through timely annual submission of those data to EPA’s STORET database. Additionally, the full dataset and summaries are provided in the Program’s Annual Report.</p>

	4. Methods and assessment procedures	Methods for detecting levels of pathogen indicators in coastal recreation areas are described in Section 3.3 of the Initial BEACH Report and the QAPP.
<b>Public Notification and Prompt Risk Communication</b>	5. Public notification and risk communication plan	Measures to notify the public, EPA and local governments when indicator bacteria levels exceed a water quality standard are provided in Chapter 4 of the Initial BEACH Report.
	6. Measures to notify EPA and local governments	Measures to notify local governments and EPA when water quality standards are exceeded are provided in Chapter 4 of the Initial BEACH Report. The Program submits notification data and actions taken to notify the public to EPA’s PRAWN database annually.
	7. Measures to notify the public	Measures to notify the public when water quality standards are exceeded are provided in Chapter 4 of the Initial BEACH Report. Upon observing an exceedance of beach advisory criteria, the Program immediately issues a public notification or resamples for bacterial exceedance of a water quality standard in accordance with the QAPP. The notification is placed on the Program’s website, disseminated to the media, and signs posted at each station are changed to indicate that an advisory is in effect.
	8. Notification report submission and delegation	<ul style="list-style-type: none"> <li>• EPA and local governments are notified annually of any notification plan changes and any delegation of responsibilities in the Program’s annual work plan.</li> <li>• The Program reports actions taken to notify the public when water quality standards are exceeded in its annual PRAWN submission and in the Program’s annual report.</li> </ul>
<b>Public Evaluation</b>	9. Public evaluation of program	The Initial Beach Report and all subsequent annual reports have been made available to the public for review and comment. The Program publishes a public notice informing the public of the availability of the annual report and the duration of the comment period, and the report is made available on the Program’s website.
