## **Acknowledgements**

Quantitative Ecological Services, Inc. (QES) thanks Jennifer Armentor, Program Administrator, Molluscan Shellfish Program, Office of Public Health, Louisiana Department of Health (LDH), Chris Lemaire, BEACH Program Manager, and Kade Ordoyne, Beach Monitoring Coordinator, for their invaluable guidance and assistance during preparation of this report. Preparation of this document would not have been possible without the assistance, expert opinion, and input of: Brian Warren, Chief Sanitarian, Special Operations, Environmental Health Services, Tiffany Meche, Director of Sanitarian Services, LDH, Kori Blich, Louisiana Department of Environmental Quality (LDEQ), and Anthony Suttice and Jackson Bollinger with the U.S. Environmental Protection Agency. LDH also wishes to acknowledge the contributions of the Town of Grand Isle, the Cameron Parish Police Jury, Louisiana Office of State Parks, and the City of Lake Charles for their contributions to successful program implementation during 2024.

## EXECUTIVE SUMMARY

This document was prepared to partially fulfill the Louisiana Department of Health’s (LDH; formerly known as Louisiana Department of Health and Hospitals [LDHH]), Office of Public Health, Center for Environmental Health Services (CEHS) reporting obligations under the U.S. Environmental Protection Agency’s (USEPA) BEACH grant program, Federal Assistance Agreement Number CU-02F37701-0. Prior to publication of this report, the document was distributed to USEPA and the Louisiana Department of Environmental Quality for comments. The comments provided by both agencies were incorporated into this report. The report was made available to the public through CEHS’s Beach Monitoring Program website (<https://ldh.la.gov/page/beach-monitoring-program>).

As documented in *Louisiana’s BEACH Grant Final Report – Grant Year 2001* (LDHH 2003; the Beach Grant Report) and *Louisiana’s Beach Program Quality Assurance Project Plan* (QAPP; LDH 2024), CEHS is to submit an annual technical report to USEPA after the end of the recreational period that summarizes the number of beaches monitored in each tier, lists any additional beaches to be added to the Program and tier reassignments to be made in the next year, presents a compilation of sampling results, and summarizes beach assessment activities and response actions. The report is to also include for Tier 1 and 2 beaches, the number of beach monitoring stations for which advisories were issued, the number of times beach advisory criteria were exceeded and the number of days under advisories for each beach monitoring station. This report satisfies the reporting obligations set forth in the Beach Grant Report and outlined above.

Monitoring was initiated and conducted on schedule from the start of the monitoring season (1 April) through the end of the season (31 October). Of 713 samples scheduled to be collected at 23 sample stations across 9 Tier 1 or 2 continuous beach segments, 664 (93%) scheduled routine samples were collected and processed. The 49 missed samples occurred at Constance Beach Complex and Holly Beach (33 missed samples), Cypermort Point State Park (2 missed samples), Elmers Island and Grand Isle (8 missed samples), Fontainebleau State Park (2 missed samples), Lake Charles North Beach (1 missed sample), and Rutherford Beach (3 missed samples). Missed samples resulted from collected samples that were not successfully processed due to lab accidents (10 samples) or mislabeling (1 sample), and 38 samples that were not collected due to tidal surge or beach damage resulting from hurricanes Beryl and Francine.

Enterococci densities were: 1) higher in 2024 than in 2023 and higher than historic norms at Constance Beach Complex, Holly Beach, Lake Charles North Beach and Rutherford Beach, with Rutherford Beach showing an increasing trend in Enterococci density since 2018, and consistent with historic norms at Fontainebleau State Park; 2) approximately equal during 2024 and 2023 and consistent with historic norms at Cypremort Point and Grand Isle State Parks, and Grand Isle Beach; and 3) lower in 2024 than during 2023 at Elmers Island, returning to its historic low level after highs during 2022 and 2023. The reason for the annual changes in enterococci densities is unknown. During 2024, salinity was lower at all beaches than in 2023 except at Fontainebleau State Park where it was higher. Annual salinity changes at sample stations are likely due to annual differences in inland rainfall and associated river discharge rates near monitored beaches. In general, higher salinity is associated with lower enterococci density within beach segments but

is not sufficiently predictive of water quality due to interaction between salinity, water temperature and precipitation.

During the 2024 swimming season (1 May – 31 October), 61 advisories and 0 closures were issued. Advisories were issued at all monitored Tier 1 or 2 sample stations during 2024 based on observed water quality exceedances. Compliance at stations monitored throughout the swimming season varied between 92% of monitored days in compliance (ELMR1), to a low of 4% (RUTH1). Across all monitored sample stations, 46% (1,928 of 4,209) of the 2024 swimming season’s available station-days (monitored station-days not under closure) were in compliance and not under an advisory.

Beach advisories issued in 2024 resulted from exceedances of enterococci geometric mean or single sample maximum criteria (the weekly sample must be  $\leq 104$  MPN/100 ml and a steady state maximum, based on a 30-day running geometric mean, must be  $\leq 35$  MPN/100). The enterococci geometric mean was exceeded in 309 of 332 (93%) observed noncompliance station-weeks, with 201 (60.5%) of those noncompliance weeks resulting from enterococci geometric mean exceedances only, 108 (31.5%) resulting from both enterococci geometric mean and single sample maximum exceedances, and 23 (7%) resulted from exceedance of enterococci single sample maximum criterion alone.

Louisiana would have issued only 43% of its 2024 advisories if the State’s decision rule were based only on the enterococci single sample maximum criterion ( $\leq 104$  cfu/100mL). If Louisiana had used the Beach Action Value (BAV) criterion of 60 cfu/100mL<sup>1</sup> during 2024 in lieu of its current criteria, 76% of the weekly advisory decisions would be unchanged, 21% of station-weeks placed under advisory for exceedance of Louisiana’s criteria would be deemed in compliance, and 3% of 2024 station-weeks exceeded the BAV criteria but were in compliance with Louisiana’s beach advisory criteria. Accordingly, Louisiana’s beach advisory criteria are more protective of public health than the BAV criterion, and Louisiana’s geometric mean criterion identifies periods of likely high risk, which result in advisories being extended for weeks with missed samples.

Based on year-end audit and data review, all completeness goals were achieved during 2024, and there were no variances from the QAPP detected other than exceedance of enterococci lab precision goals. Results for all samples were considered valid and recorded in the Program’s database. All monitoring and notification data collected during 2024 have been uploaded to the appropriate USEPA data storage systems (available through EPA’s Water Quality Portal (<https://www.waterqualitydata.us/>) and BEACON (<https://watersgeo.epa.gov/beacon2/about.html>)).

In preparation for the 2025 Beach monitoring season, risk levels at Program beaches were reassessed to determine whether additional beaches warranted monitoring. Risk is a function of historical water quality conditions, based on past sampling, and beach use. Based on observed use levels and patterns during the 2024 swimming season and projections of use for the 2025

---

<sup>1</sup> As recommended in *National Beach Guidance and Required Performance Criteria for Grants*, EPA-820-D-13-001, dated April 18, 2014.

swimming season, it is anticipated that use levels and patterns will remain at approximately historical levels for all beaches.

The anticipated use and historical water quality risk levels resulted in the 2025 monitoring season classification of six continuous beach segments as Tier 1 beaches (Fontainebleau State Park [FNTB], Elmer’s Island [ELMR], Grand Isle [GISP] and Cypremort Point State Parks [CYPTSP], Holly Beach [HOLLY], and Lake Charles North Beach [LCNB]), three beach segments as Tier 2 (Grand Isle Beach [GIB], the Constance Beach Complex [CNSTBC], and Rutherford Beach [RUTH]), and one Tier 4 beach segment (Elmer’s Island East). Based on 2024 sampling and 2025 expected use, it is anticipated that approximately 6 beach miles of Tier 1 beaches, approximately 14 miles of Tier 2 beaches, and 0 of 1.96 miles of Tier 4 beaches will be monitored during 2025.

## CHAPTER 1. Purpose, Background and 2024 Program Accomplishments

### Purpose

According to *Louisiana’s BEACH Grant Final Report – Grant Year 2001* (the Beach Grant Report; LDHH 2003) and *Louisiana’s Beach Program Quality Assurance Project Plan* (QAPP; LDH 2024), the Louisiana Department of Health (LDH; formerly known as Louisiana Department of Health and Hospitals [LDHH]), Office of Public Health (OPH), Center for Environmental Health Services (CEHS) is to submit an annual technical report to the U.S. Environmental Protection Agency (USEPA) after the end of the recreational period. The report should accomplish the following: summarize the number of beaches monitored in each tier, list any additional beaches to be added to the Program and tier reassignments to be made in the coming year, provide a compilation of the sampling results, and summarize beach assessment activities and response actions. This annual technical report for the 2024 recreational period satisfies all the requirements described above.

This document consists of four chapters. In this chapter, 2024 Program accomplishments are summarized. Chapter 2 contains a summary of the number of beaches that were monitored in each tier, and a description of updates to Louisiana’s BEACH Program, as anticipated under the Beach Grant Report. Louisiana’s BEACH Program updates include descriptions of 2024 Program modifications and changes to tier assignments and beaches to be monitored under the Program in 2025. In Chapter 3, monitoring and response actions for 2024 are provided. Data quality assessment results for the 2024 swimming season are presented in Chapter 4. Appendix A contains station IDs and names, USEPA IDs, locations (latitude and longitude), beach lengths, and maps of beach sample sites. Appendixes B through D contain graphical time series analyses of water quality data, sample results, and a summary of how Louisiana’s BEACH Program has fulfilled the original BEACH Grant requirements, respectively.

### Background

Water is one of Louisiana’s greatest natural resources. Louisiana’s vast estuarine basins provide a unique playground for swimming, wading, boating, fishing, and other aquatic activities; however, swimming in waters with high bacteria densities from fecal sources are a known threat to public health, causing elevated rates of gastrointestinal illness. Louisiana Department of Environmental Quality (LDEQ) has historically conducted routine ambient monitoring of state coastal waters designated for primary contact recreation and utilized fecal coliform criteria to assess attainment of ambient water quality standards for swimming uses. However, coastal recreation waters and “high-use” swimming waters had not been designated in state regulations by LDEQ, and there were no mechanisms in place to routinely sample water quality or to provide the public with the results of risk-based analyses that allow for an informed decision prior to swimming at coastal beaches.

In response to growing concern about public health risks posed by polluted bathing beaches, the U.S. Congress passed the BEACH Act in 2000. In 2001, the USEPA, under the provisions of the BEACH Act, made grant funds available to the OPH for the development of a monitoring and notification program for high-use coastal recreation sites, referred to as Louisiana’s BEACH

Program. Since initial grants were awarded, Louisiana’s BEACH Program has been developed and successfully implemented under the guidance of the CEHS, in cooperation with LDEQ.

Consistent with USEPA’s guidance, Louisiana’s BEACH Program consists of two primary activities: monitoring and notification. Since bacteriological contaminants cannot be effectively monitored directly, monitoring for fecal contamination of surface waters requires the identification of indicator organisms that are associated with fecal contamination and readily monitored using available technologies. Like most other states, Louisiana historically used fecal coliform densities as the indicator of bacteriological contamination of surface waters. However, under the terms of BEACH grant awards, states must base decisions about marine water quality at sites monitored using BEACH grant funds on enterococci bacteria densities. Enterococci have become accepted by the scientific community as more closely associated with rates of gastrointestinal illness in marine environments than fecal coliform densities, and thus USEPA believes that the use of enterococci may serve to better protect the public health in marine environments.

The second primary activity under the Program is public notification. Louisiana’s BEACH Program issues public health advisories at Tier 1 and 2 monitored sites (tiers are defined in Chapter 2) when water quality samples are found to exceed the beach advisory enterococci criteria. The advisory criteria consist of a single sample maximum (the weekly sample enterococci density must be  $\leq 104$  MPN/100 ml) and a steady state maximum, based on a 30-day running geometric mean ( $\leq 35$  MPN/100 ml). Advisories urge users to abstain from swimming, but do not officially “close” the water body to recreational use. The Program disseminates swim advisories by website postings, and by opening pole-mounted signs which are installed at the beach monitoring sites. When water quality sample results indicate that bacteria levels at beach sites under swim advisories are once again compliant with the advisory criteria, the public is notified that the advisory has been lifted through beach signage and the website (<https://ldh.la.gov/page/beach-monitoring-program>).

### 2024 Program Accomplishments

During 2024, Louisiana’s BEACH Program:

1. Monitored all accessible sample sites designated for monitoring in accordance with the requirements of their tier assignment throughout the swimming season; and
2. Continued to meet or exceed the quality assurance/quality control goals established in the Program’s QAPP (LDH 2024), except as noted in Chapter 4.

## CHAPTER 2 - Update of BEACH Program

### Review of Beach Rankings

In 2003, the CEHS completed a systematic process to identify and rank Louisiana’s beaches according to risk. The process consisted of the following steps (LDHH 2003):

1. Identification and definition of coastal recreation waters;
2. Identification of beaches or similar points of access used by the public for swimming, bathing, surfing, or similar water contact activities;
3. Review of available information on levels of potential fecal contamination at beaches and intensity of beach use; and
4. Ranking of beaches to decide which would be included in Louisiana’s BEACH Program.

Based on levels of beach use and perceptions of water quality from estimated fecal coliform densities in adjacent waters, a qualitative ranking scheme was devised and used to assign each beach to an appropriate monitoring tier. The monitoring tiers define levels of monitoring and public notification such that beaches with a greater density of swimmers, and thus a greater number of people at risk, receive a higher intensity of monitoring and public notification than lower use beaches. Monitoring and public notification procedures are the same at Tier 1 and Tier 2 beaches, but sample station density differs. Sample stations are closer together at Tier 1 beaches, no more than 500 meters apart, while sample stations are no more than 2 miles apart on continuous beach segments at Tier 2 beaches. Sample stations at Tier 3 and 4 beaches are at the same density as Tier 2 beaches, but samples are not collected weekly, and accordingly, weekly public advisories are not issued for Tier 3 and 4 beaches. Tier 4 beaches meet the same criteria specified for Tier 3 beaches, which are described below, but due to very limited primary contact recreation use and historically good water quality, are not monitored.

The initial assignments of beach segments to monitoring tiers were completed in 2003 (LDHH 2003). The estimated number of swimmers at each beach was based on information obtained primarily from law enforcement officials responsible for patrolling the beach and from park managers. The officials provided estimates of the number of beach visitors on a typical weekday, weekend, and holiday during the peak swimming season, May 1 through Labor Day, along with an estimate of the percentage of beach users entering the water. These estimates were combined by adding typical weekday and weekend use to provide an estimate of weekly use. Weekly use was multiplied by the number of weeks in the recreational period and added to the estimated number of holiday visitors during Memorial Day, Fourth of July, Labor Day, and any other beach-specific major events. Because the resulting total was an estimate of unknown precision, those estimates were generalized into broad categories of use for relative comparison as follows:

<b>Category of Use</b>	<b>Estimated Number of Swimmers Annually</b>
Very Low	<5,000
Low	5,000 to <10,000
Moderate	10,000 to <15,000
High	15,000 to 20,000
Very High	>20,000

Because beach water quality was either inferred from the water quality of the surrounding area or based on a brief period of data, and no studies were available providing a model of the site-specific relationship between fecal coliform concentrations and illness rates, the qualitative ranking process relied primarily on beach use. Beaches classified as having very high, or high use were assigned to Tier 1 and receive the most monitoring attention. Beaches classified as having moderate use were assigned to Tier 2. Beaches with low or very low use were assigned to Tier 3 and targeted for additional bacterial indicator monitoring to better characterize risk. Beaches on private land or with existing swimming advisories posted by the State, and with very low public use, were excluded from further consideration. A total of 29.16 miles of beach were considered for monitoring under Louisiana’s BEACH Program, of which 23 miles were assigned to a monitoring tier (LDHH 2003).

CEHS anticipated that beach use and water quality could change through time and planned to re-evaluate beach rankings on an annual basis at the end of each swimming season (LDHH 2003). In 2006, it was decided that the Program would continue to evaluate risk primarily on the estimated density of swimmers at a beach in accordance with the original categories of use described above, but a new method of assessing water quality risk was developed. The original assessment evaluated water quality based on estimated fecal coliform densities, which was the only beach specific indicator organism data available at the time. Data collected during 2004 and 2005 provided new information about water quality, including enterococci densities, which were not previously available. Because USEPA’s chosen indicator organism for marine waters is enterococci, and because greater than 99.8% of all of Louisiana’s swim advisories issued through 2005 involved exceedance of beach advisory enterococci criteria, new water quality categories based on enterococci densities were developed for use in the risk-based tier assignment process (LDHH 2006).

A sample station’s annual enterococci geometric mean density was strongly correlated with the percentage of monitored weeks under advisory, so a sample station’s geometric mean is a good indicator of the likelihood of exceeding the established limits of acceptable risk. Accordingly, beginning in 2006 water quality risk categories were based on the ratio of a beach’s prior year’s annual enterococci geometric mean to the enterococci geometric mean decision criterion of 35 MPN/100 ml. Water quality risk categories were established as: “Lower Risk” if the beach’s annual geometric mean/35 < 0.5; “Moderate Risk” if the beach’s annual geometric mean/35  $\geq$  0.5 and < 1; and “Higher Risk” if the beach’s annual geometric mean/35  $\geq$  1. Continuous beach segments are reassigned annually to tier risk categories based on beach segment-specific enterococci water quality risk categorization and expected beach use. Table 1 identifies the beaches that were monitored under the Program during 2024, their designated 2024 monitoring tier, and associated sample stations.

During 2024, six continuous beach segments were designated as Tier 1 beaches and scheduled for monitoring (Grand Isle, Cypremort Point, and Fontainebleau State Parks; Elmer’s Island, Holly Beach, and North Beach in Lake Charles), and three continuous beach segments were designated as Tier 2 (Grand Isle Beach, Rutherford Beach, and the Constance Beach Complex). All beach segments were monitored at their designated tiers during 2024. Elmer’s Island-East (ELMR2) was assigned to Tier 4 for the 2024 swim season due to very low usage in accordance with EPA guidance (the beach is used by the public but not monitored).

**Table 1.** Continuous beach segments, beach miles, monitoring tier assignments for 2024 and 2025, and sample stations.

Continuous Beach Segments	Designated Beach Miles	First Year Sampled	2024 Designated Monitoring Tier <sup>2</sup>	2024 Actual Monitoring Tier <sup>2</sup>	2025 Designated Monitoring Tier <sup>2</sup>	Sample Station State IDs <sup>1</sup>

Note: <sup>1</sup> Sample station names, USEPA IDs and locations are provided in Appendix A.; <sup>2</sup> Tier assignments based on risk categorization; Tier 4 indicates a tier 3 beach that is used by the public and is not monitored.

In summary, during 2024, the Program monitored all six continuous Tier 1 beach segments (approximately six beach miles), including sampling and public notification at all 14 of the Tier 1 sample stations (Table 2). Three Tier 2 continuous beach segments totaling approximately 14 miles were also monitored during 2024, including sampling and public notification at all 9 sample stations. One Tier 4 sample station on Elmer’s Island East (ELMR2) was not scheduled to be monitored during 2024.

Using water quality data pooled across sample stations within continuous beach segments, water quality risk categories were calculated for each continuous beach segment for use in establishing 2025 Tier assignments (Table 3). Two systems of beach water quality assessment were used, the Louisiana BEACH Program’s beach risk classification, as described above, and the World Health Organization’s (WHO) risk categorization system. The WHO’s microbial water quality assessment criterion (WHO 2003) was applied to the last three years (2022–2024) of Louisiana’s BEACH water quality data. In addition to water quality, the WHO classification system uses sanitary inspection categories to classify waters from very good to very poor, depending on the beach’s susceptibility to fecal influence as determined by a sanitary survey, but only the microbial criterion was evaluated for the purposes of this report. Rather than rely on the annual enterococci geometric mean for its microbial criterion, the WHO uses the parametric 95<sup>th</sup>

percentile of observed enterococci densities over a longer-term period, typically a minimum of three years. The WHO selected the 95<sup>th</sup> percentile because it is easily understood and reflects much of the top-end variability in the distribution of water quality data that are of greatest public health concern and is robust against periodic variation in water quality. The WHO classifies water quality into four categories based on enterococci density (colony forming units [cfu]/100 ml) and the associated risk of acquiring gastrointestinal illness as follows: A) <1 case in 100 exposures, 95<sup>th</sup> percentile ≤40 cfu/100 ml; B) between 1 and 5 cases in 100 exposures, 95<sup>th</sup> percentile 41-200 cfu/100 ml; C) between 5 and 10 cases in 100 exposures, 95<sup>th</sup> percentile 201-500 cfu/100 ml; and D) >10 cases in 100 exposures, 95<sup>th</sup> percentile >500 cfu/100 ml. For comparison, the USEPA’s gastrointestinal illness rate associated with the 1986 recommended beach advisory enterococci criteria for marine recreational waters is 19 illnesses per 1,000 swimmers and the 2012 recommended enterococci criteria is 32-36 gastrointestinal illnesses per 1,000 swimmers, both of which falls within WHO category B. To facilitate comparison with Louisiana’s risk categories, we have categorized WHO classes A and B as lower risk, C as moderate, and D as higher risk.

**Table 2.** Number of continuous beach segments, sample stations, and beach miles monitored by Tier during 2024 and planned for 2025.

Tier	2024 (Actual)				2025 (Projected)			
	1	2	3	4	1	2	3	4
Number of Continuous Beach Segments	6	3	0	1	6	3	0	1
Number of Sample Stations	14	9	0	1	14	9	0	1
Total Beach Miles	6	14	0	2	6	14	0	2
Number of Continuous Beach Segments Monitored	6	3	0	0	6	3	0	0
Number of Sample Stations Monitored	14	9	0	0	14	9	0	0
Total Beach Miles Monitored	6	14	0	0	6	14	0	0

Water quality calculated using the Louisiana and the WHO risk categorization systems generally agreed. Differences between the two categorization schemes can result from using different time periods (Louisiana’s risk categorization uses only the prior year, where the WHO uses three prior years), and metrics (geometric mean versus 95<sup>th</sup> percentile). Using the modified WHO risk categorization results, two continuous beach segments were classified in the B WHO risk category (Grand Isle Beach and Grand Isle State Park), four in risk category C (Constance Beach Complex, Cypremort Point and Fontainebleau State Parks, and Holly Beach) and three in risk category D (Elmer’s Island, Lake Charles North Beach, and Rutherford Beach). Similarly, Louisiana’s risk categorization resulted in two continuous beach segments classified in the lower water quality risk category (Grand Isle Beach and Elmer’s Island), one in the moderate risk category (Grand Isle State Park) and six in the higher risk category (Constance Beach Complex, Cypremort Point and Fontainebleau State Parks, Holly Beach, Lake Charles North Beach, and Rutherford Beach). Differences between the modified WHO risk categorization and Louisiana’s risk categorization for Elmer’s Island (D versus Lower, respectively) result from higher water quality risk in 2022 and 2023, but lower risk in 2024.

**Table 3.** Beach water quality and use risk categories for the 2025 swimming season based on anticipated use in 2025 and 2024 water quality data.

<b>Beach</b>	<b>Anticipated 2025 Use</b>	<b>2024 Entero. Geometric Mean</b>	<b>2024 Entero. Geometric Mean / 35</b>	<b>2024 Water Quality Risk Cat.</b>	<b>Entero. 95<sup>th</sup> Parametric Percentile 2022-2024</b>	<b>WHO Risk Category<sup>1</sup></b>
CNSTBC	Low	44.5	127%	Higher	384	C
CYPT	Mod.-High	41.4	118%	Higher	240	C
ELMR	High	11.3	32%	Lower	948	D
FNTB	High	35.9	102%	Higher	273	C
GIB	Moderate	15.1	43%	Lower	135	B
GISP <sup>2</sup>	Very High	17.7	50%	Moderate	143	B
HOLLY	Mod.-High	41.4	118%	Higher	292	C
LCNB	Very High	97.7	279%	Higher	590	D
RUTH	Very Low	115.6	330%	Higher	810	D

Note: <sup>1</sup> WHO risk categorization based on 2022-2024 water quality data due to the requirement for a three-year evaluation term (risk categories previously defined in body of the report).

The Louisiana BEACH Program’s beach risk classification was used in assigning beaches to tiers. Combined 2025 anticipated use and 2024 water quality rankings for each continuous beach segment are given in Table 4. As discussed above, tier categories remain based on the same swimmer density categories that were used in the original tier designation system, but low and very low use categories are designated as “Discretionary.” For “Discretionary” beach segments, the Louisiana BEACH Program Manager will decide if Tier 2, 3 or 4 level monitoring is warranted at any time during the monitoring season. Because of the very low to low use at Constance Beach Complex and Rutherford Beach, but Higher Risk water quality determination based on 2024 water quality data, it is anticipated that they will remain Tier 2 beaches during 2025; therefore, all 2024 beach tier assignments are expected to remain in place for 2025 as shown in Table 1. Elmer’s Island-East (ELMR2) will not be monitored during 2025 due to continued very-low use and it is designated as a Tier 4 beach. To summarize, in 2025 the Program is expected to monitor all Tier 1 beaches totaling 5.8 beach miles, all Tier 2 beaches totaling 14 miles, and 0 of approximately 1.9 Tier 4 beach miles.

In addition to annually re-evaluating risk levels and associated tier designations for beach segments monitored during the previous year, the program determines if any additional beaches warrant monitoring. No additional beaches were identified for inclusion under the Program in 2025.

Program Modifications

No modifications were made to the Program’s procedures, methods, or decision rule during 2024. The Program followed the procedures, methods and decision rule summarized in *Louisiana’s BEACH Program Quality Assurance Project Plan*, which is available on the World Wide Web at [https://ldh.la.gov/assets/oph/Center-EH/sanitarian/beach/LaQAPP\\_v2\\_Final\\_ALLSIGNATURES.pdf](https://ldh.la.gov/assets/oph/Center-EH/sanitarian/beach/LaQAPP_v2_Final_ALLSIGNATURES.pdf)

**Table 4.** Combined beach use and water quality risk categories for 2025.

		Water Quality Risk <sup>1</sup> =>			
		Lower Risk	Moderate Risk	Higher Risk	
# of Swimmers	VH		GISP	LCNB	Tier 1
	H	ELMR1		CYPT, FNTB, HOLLY	
	M	GIB			Tier 2
	L			CNSTBC <sup>2</sup>	Tier 3
	VL	ELMR2 <sup>3</sup>		RUTH <sup>4</sup>	
		<b>Discretionary</b>			

Notes: <sup>1</sup>Water quality risk level based on 2024 data using Louisiana’s risk classification. <sup>2</sup>CNSTBC will be monitored as tier 2 during 2025. <sup>3</sup>ELMER2 is classified as a Tier 4 beach for 2025 because of very low use and historically Lower Risk water quality and will not be monitored in 2025. <sup>4</sup>RUTH will be monitored as a tier 2 beach during 2025.

### CHAPTER 3. Louisiana BEACH Program’s 2024 Results

#### Number of Samples Collected

Between 1 April 2024 and 31 October 2024, a total of 734 samples were collected at 23 sample stations (see Table 5), distributed among three sample types: field duplicates and splits, and routine samples. Each type of sampling is described below.

**Table 5.** Total number of samples collected by sample station and sample type during 2024 by Louisiana’s BEACH Program.

Sample Station	Sample Type				Station Total
	Field Duplicate	Field Split	Resample	Routine	
CNST1	0	0	0	28	28

<b>Sample Type Total</b>	33	37	0	664	734

Routine samples are the regularly scheduled weekly samples collected during the designated monitoring period at beaches that are officially part of the Program. During the 2024 monitoring

period, 713 routine samples were scheduled to be collected across the 23 monitored sample locations. Of the 713 scheduled routine samples, 664 (93%) were collected and processed. Samples were collected during the week of June 30 at Elmers Island, Grand Isle and Fontainebleau State Park (9 samples), August 11 at Rutherford Beach, and October 6 at Cypremort Point State Park but were not successfully processed due to lab accidents or sample mislabeling (1 sample). Samples were not collected during the week of July 7 at Constance Beach Complex, Holly Beach, and Rutherford Beach (12 samples), September 8 at Constance Beach Complex, Holly Beach, Rutherford Beach, Cypremort Point State Park and Lake Charles North Beach (14 samples), September 15 at Fontainebleau State Park due to storm surges or beach damage from Hurricanes Beryl and Francine. Samples were also not collected during the week of October 20 at Constance Beach Complex and Holly Beach (11 samples) due to personnel availability.

Resamples are collected at the BEACH Program Manager's discretion when a routine sample has an unexpectedly high indicator organism density or when the source of an exceedance is known and has been corrected and extra samples are required to calculate a post-event geometric mean. Zero resamples were collected during 2024.

Field duplicates and field splits are two types of quality control (QC) samples. Field duplicates were used to estimate the precision of sampling methods by comparing laboratory results for two samples taken consecutively on the same day at the same sampling site (i.e., one grab is considered the routine sample or resample and the other the QC sample). Field splits were used to estimate the precision of laboratory analyses (intra-laboratory) plus any variability induced during sample handling and transport by analyzing two aliquots of the same water sample (i.e., one-half of the split sample is considered the routine sample or resample and the other half the QC sample), which were subdivided in the field. Louisiana's BEACH Program QAPP requires that approximately 10% of scheduled routine sample events be designated as quality control samples, which are selected at random at the beginning of the sampling period in approximately equal proportions ( $\approx 5\%$  each) of field duplicate and field split samples. QC samples may also be collected during resample events to improve the precision of estimated indicator organism densities by averaging resample and QC sample results. A total of 72 QC samples were scheduled to be collected concurrent with the 664 routine samples that were collected and were to consist of 33 field duplicates and 39 field split samples. A total of 33 field duplicates and 39 field split samples were collected during 2024. Thirty-two (32) field duplicates were sampled as scheduled (97%), and 37 field split samples were collected as scheduled (95%), resulting in 96% of QC samples collected as scheduled. One field duplicate and one field split QC sample were missed when scheduled, and one field duplicate was collected when a field split was scheduled. Accordingly, 70 of the 72 (97%) anticipated QC samples were collected.

Of the 734 total samples, all were collected during the designated monitoring period, and those collected at Tier 1 and 2 beaches were used to make weekly water quality decisions. For analysis purposes, samples collected on the same date at the same location were not considered independent, and were averaged together (i.e., arithmetic mean) resulting in a total of 664 independent samples collected during the 2024 designated monitoring season (see Table 6).

Summary Statistics for 2024 Designated Monitoring Period Samples

Results of enterococci density (MPN/100ml) and salinity (parts-per-thousand; ppt) for each sample location during the 2024 designated monitoring period are summarized in Table 7 and depicted graphically in Figures 1 and 2. Because indicator organism densities are lognormal distributed, Table 7 presents  $\log_e$  mean and  $\log_e$  standard deviations; exponentiation of the  $\log_e$  mean produces the geometric mean on the nominal scale. Note that the  $\log_e$  enterococci median shown in the graph and  $\log_e$  mean in Table 7 are approximately equal as would be expected for lognormal distributed populations.

**Table 6.** Number of independent samples collected by sample station during the 2024 monitoring season (1 April – 31 October). Samples collected at the same station on the same day are counted as a single sample.

**Figure 1.** The distribution of log<sub>e</sub> transformed enterococci densities (MPN/100ml) by sample station relative to the geometric mean (GeoMean) and single sample (S.S.) maximum criteria for samples collected during the 2024 designated monitoring season. The box represents the inner quartile range (25<sup>th</sup> to 75<sup>th</sup> percentiles), and upper and lower whiskers extending from the box represent the smallest and largest observations within one step (1.5 times inner quartile range). The median (◇) is marked by a line through the box, and horizontal bars (—) represent extreme values.

**Figure 2.** The distribution of salinity (ppt) by sample station for samples collected during the 2024 designated monitoring season.

Time-Series of 2024 Designated Monitoring Period Samples

In addition to calculating summary statistics for each sample station over the 2024 designated monitoring period, results are presented as a time-series (Appendix B, Figures B.1 through B.23; data for each sample event is provided in Appendix C). Because sample results were used during the designated monitoring season to make weekly determinations of whether water quality at each sample station met the Program’s beach advisory criteria for Tier 1 and 2 beaches, sample results and the running 30-day geometric mean are shown in the figures. In each week, the last enterococci sample of the week and the running 30-day geometric mean for enterococci must both be less than or equal to their respective criterion for the sample station to be classified as in compliance. If either criterion was exceeded, the sample station was classified as out of compliance and a swimming advisory was issued. The advisory remained in effect until the most recent sample results and the running geometric mean were each less than or equal to their respective criterion.

### Weekly Decision Rule Outcomes

During the 2024 swimming season (1 May – 31 October), 23 sample stations were monitored at 9 Tier 1 or Tier 2 continuous beach segments with a total of 61 advisories and 0 closures issued. Advisories were issued at all monitored Tier 1 or 2 sample stations during 2024 based on observed exceedances of enterococci geometric mean and single sample maximum criteria (see Tables 8 and 9). Compliance at stations monitored throughout the swimming season varied between 92% of monitored days in compliance (ELMR1), to a low of 4% (RUTH1). Across all monitored sample stations, 46% (1,928 of 4,209) of the 2024 swimming season’s available station-days (monitored station-days not under closure) were in compliance and not under an advisory.

As in past years, most 2024 advisories were issued due to exceedances of the enterococci geometric mean criterion (Table 10). The enterococci geometric mean (GeoMean) was exceeded in 309 of 332 (93%) observed noncompliance station-weeks, with 201 (60.5%) of those noncompliance weeks resulting from enterococci geometric mean exceedances only, 108 (31.5%) resulting from both enterococci geometric mean and single sample maximum exceedances, and 23 (7%) resulted from exceedance of enterococci single sample maximum criterion alone.

As discussed in previous Louisiana BEACH Grant reports, Louisiana’s percentage of station-weeks that were under advisory is not directly comparable with other states that do not use equivalent beach advisory criteria. Limiting comparison of advisory decision outcomes to sampled weeks, if Louisiana had used only the single sample maximum criterion ( $\leq 104$  cfu/100mL) as some states have, Louisiana would have issued only 43% (143 of 334) of its 2024 advisories. Applying the Beach Action Value (BAV) criterion of 60 cfu/100mL<sup>2</sup> to Louisiana’s 2024 monitoring results<sup>3</sup>, 76% of the weekly advisory decisions would be unchanged, 21% of station-weeks placed under advisory for exceedance of Louisiana’s criteria would be deemed in compliance, and 3% of 2024 station-weeks exceeded the BAV criteria but were in compliance with Louisiana’s beach advisory criteria. Additionally, Louisiana’s GeoMean criterion identifies periods of likely high risk, which result in advisories being extended during weeks with missed samples.

When exceedances of beach advisory criteria were detected, an advisory was issued. To notify the public that a swimming advisory was in effect, the BEACH Program’s monitoring/advisory sign at the sample site was opened and a notice of the advisory was placed on the OPH BEACH website (<https://ldh.la.gov/page/beach-monitoring-program>).

---

<sup>2</sup> As recommended in *National Beach Guidance and Required Performance Criteria for Grants*, EPA-820-D-13-001, dated April 18, 2014.

<sup>3</sup> Analysis limited to the swimming season sampled week; Weeks without a sample were excluded from analysis.

Relationship between Indicator Organisms and Environmental Conditions

With each water sample collected by the BEACH Program, environmental variables were also collected, including surface water temperature (°F), salinity (ppt), tide conditions, weather conditions, and wind direction and speed. Total precipitation (in.) 0–24 hrs (precip0), 24–48 hrs (preciplag1), 48–72 hrs (preciplag2), and 72–96 hrs (preciplag3) prior to sample collection were estimated using rain basin precipitation values taken from Louisiana’s Molluscan Shellfish database. Rain basins are the coastal portion of river basins to which nearby rain gauges were

associated; large basins (basins 2, 4, and 12) were split to limit the distance of associated rain gauges to <30 miles. Rain basin daily precipitation was estimated by averaging observed precipitation at rain gauges within the rain basin, and beaches were assigned to the rain basin in which they occurred. The number of days between sample collection and the most recent prior day with a precipitation record > 0 (DaysSinceLastRain) was estimated, and daily precipitation estimates were summed into measures of total precipitation within 0–48 hrs (precip48) and 0–72 hrs (precip72) prior to sample collection (those data are available upon request).

Using the observed environmental variables, estimated precipitation values and the associated  $\log_e$  transformed enterococci densities collected by the Program from 2004 through 2009, CEHS performed a thorough statistical analysis to determine how indicator organism density was influenced by environmental factors at Louisiana’s coastal beaches (the 2009 analysis). The results of the 2009 analysis confirmed the findings of previous reported analyses that there were no statistically meaningful differences among sample stations within continuous beach segments (StateID explains almost none of the variation in enterococci density), and that enterococci densities had changed from year to year at all beach segments except Fourchon, which had remained stable. The complete results of the 2009 analysis were reported in the *Louisiana BEACH Grant Report, 2009 Swimming Season*, which concluded that:

“given the available data, it is unlikely that models that can reliably predict enterococci densities can be developed for Louisiana’s beaches. Different environmental factors are most correlated with enterococci density for different beach segments and area groups, and no single environmental factor is useful in predicting indicator organism density. It also appears that the relationship between environmental factors and enterococci density is complex and will take more investigation to understand, requiring targeted studies that are not funded under current Beach Grants. Better measurement of the environmental variables that are currently being collected and/or collection of additional environmental measures may be required to adequately predict water quality from observable environmental conditions. Louisiana beaches are somewhat different from those of most coastal states in that they represent a wide range of salinity conditions, and most are relatively remote from urban runoff, reducing the direct association between environmental conditions and enterococci densities.”

Through 2011, a total of 5,164 independent<sup>4</sup> samples were collected: 1,555 samples beyond those available in 2009. Given the additional data available, the analysis was repeated and yielded the same conclusions as were drawn following the 2009 analysis. That is, year-to-year differences in enterococci density at all beach segments other than FOUR was a significant source of variation, and that for most beach segments, the relationship between the environmental variables and enterococci density changed from year to year. Additionally, the observed year-to-year variation in enterococci density was not explained by corresponding differences in the environmental variables. Because of large year-to-year differences in enterococci densities and associated annual variance within beach segments, and annual differences in the relationship between enterococci density and the environmental variables as shown in the 2011 Annual Beach Report, developing useful statistical models that go beyond

---

<sup>4</sup> For analysis purposes, single samples collected on a date at a sample location were considered independent; multiple samples collected on a date at a sample location were averaged together.

describing general patterns of association between environmental conditions and enterococci densities may not be possible for Louisiana’s more remote beaches.

Figure 3 shows the considerable annual variation in enterococci densities within beach segments from Program inception through 2024. Enterococci densities were: 1) higher in 2024 than in 2023 and higher than historic norms at Constance Beach Complex, Holly Beach, Lake Charles North Beach and Rutherford Beach, with Rutherford Beach showing an increasing trend in Enterococci density since 2018; and consistent with historic norms at Fontainebleau State Park; 2) approximately equal during 2024 and 2023 and consistent with historic norms at Cypremort Point and Grand Isle State Parks, and Grand Isle Beach; and 3) lower in 2024 than during 2023 at Elmers Island, returning to its historic low level after highs during 2022 and 2023. The reason for the annual changes in enterococci densities is unknown.

**Figure 3.** Distribution of  $\log_{10}$  enterococci densities by year within continuous beach segments relative to geometric mean criterion (red dashed lines) and single sample maximum criterion (blue dotted lines).

During 2024, salinity was lower at all beaches than in 2023 except at Fontainebleau State Park where it was higher (Figure 4). Annual salinity changes at sample stations are likely due to annual differences in inland rainfall and associated river discharge rates near monitored beaches. In general, higher salinity is associated with lower enterococci density within beach segments but is not sufficiently predictive of water quality due to interaction between salinity, water temperature and precipitation.

**Figure 4.** Distribution of salinity (ppt) by year within continuous beach segments.

**CHAPTER 4. Evaluation of Program Performance Relative to Data Quality Objectives.**

*Louisiana’s BEACH Program Quality Assurance Project Plan* (LDH 2024) states that at the end of each year, the Program Manager shall audit the Program to determine if the Program’s data quality objectives are being met. As described in the QAPP (see Table A7.1 of the QAPP), the Program’s data quality objectives for those parameters measured in accordance with the QAPP are expressed in terms of precision and completeness goals. Those data quality objectives are repeated below in Table 11, together with their 2024 results.

**Table 11.** Data quality objectives and 2024 results.

<b>Parameter</b>	<b>Concentration Units</b>	<b>QAPP Precision Goals (RPD)</b>	<b>2024 Precision Mean RPD (<math>\pm 1</math> SE, n)</b>	<b>QAPP Completeness Goals</b>	<b>2024 Completeness</b>
Enterococci	MPN/100ml	Sample $\leq 60\%$ ; lab $\leq 45\%$	Sample 60.4% ( $\pm 9.7$ , 33); lab 72.8% ( $\pm 8.6$ , 37)	98%	100%
Salinity	ppt	Sample $\leq 10\%$ , lab $\leq 5\%$	Sample 0.4% ( $\pm 0.1$ , 33); lab 0.5% ( $\pm 0.2$ , 37)	98%	100%
Surface Water Temperature	$^{\circ}$ F	$\pm 2^{\circ}$	$\pm 2^{\circ}$ by SOP	98%	100%
Tide Conditions	NA	NA	NA	98%	100%
Weather	NA	NA	NA	98%	100%
Wind Direction	NA	NA	NA	98%	100%
Wind Speed	NA	NA	NA	98%	100%
Precipitation	Inches/ previous 24 hours	NA	NA	98%	99%
River Stage	Feet on flood gauge	NA	NA	98%	100%

To evaluate compliance with the established data quality objectives (DQOs) for sample and laboratory precision on estimated indicator organism densities and salinity, the results from QC samples, which are always collected in conjunction with a routine sample or resample, were compared to the corresponding sample result. Prior to the start of the monitoring period, approximately 10% of scheduled routine samples were designated as quality control samples. QC samples were selected at random at the beginning of the sampling period in approximately equal proportions (~ 5% each) of field duplicate and field split samples. Field splits were designed to estimate the variability of the analysis process, or “lab” precision, plus any minor imprecision resulting from sample handling and transport. Field duplicates were designed to incorporate lab variability plus sampling variability to estimate the variability of collecting another sample at approximately the same place and time. Any unscheduled QC samples that were collected during routine sample events were also included in the QC evaluation.

Sampling and laboratory precision were estimated from each quality control sample by calculating the relative percent difference (*Sample RPD*) as follows:

$$\text{Sample RPD} = \frac{|C_1 - C_2|}{(C_1 + C_2)/2} \times 100$$

where  $C_1$  is the routine sample (or resample) result and  $C_2$  is the quality control sample result. To estimate precision across samples, the mean and standard error of Sample RPDs were calculated. Note that the precision goals are expressed as means, and compliance with precision goals is assessed by determining if the observed precision is statistically different from the goal.

As described in Chapter 3, a total of 70 quality control samples were collected during 2024, consisting of 33 field duplicates and 37 field-split samples. To evaluate compliance with QAPP precision goals, means and standard errors of sample RPDs were calculated for the 2024 QC samples and are presented in Table 11. Figures 5 and 6 show Sample RPD results relative to precision goals; if the lower error bar (lower 95<sup>th</sup> percentile) shown in the graph is below the goal, then the goal has been achieved.

Sample (field duplicate) precision goals for enterococci and sample salinity precision goals were achieved for 2024; however, the lab enterococci precision goal (field split) was not achieved. The enterococci lab precision goal is  $\leq 45\%$  but the lab precision RPD for 2024 was 73% ( $\pm 8.6$ ). As sample precision measured with field duplicates incorporates lab variability plus the variability of collecting another sample at approximately the same place and time, it should always be higher than lab variability; however, sample precision RPD was less than lab precision RPD for both enterococci and salinity. This suggests that some samples recorded as field splits were collected as field duplicates in error and/or greater care needs to be used when preparing field split samples. This variance from the QAPP is not expected to have adversely impacted beach advisory decisions as routine and QC sample results are averaged for advisory decisions and all other calculations. At the start of 2025 sampling, the Beach Program Manager will meet with field staff to ensure that they are properly collecting, handling, and recording QC samples.

Completeness is the percentage of measurements made that are judged to be valid according to specific criteria and entered in the data management system. Percent completeness (%C) for measurement parameters was estimated as follows:

$$\%C = \frac{V}{T} \times 100$$

where  $V$  is the number of measurements judged valid, and  $T$  is the total number of measurements. During 2024, a total of 734 samples were successfully processed, and all results were considered valid and recorded in the Program's database.

Based on a thorough review of the data recorded for the 2024 season, all completeness goals were achieved and there were no variances from the QAPP detected other than exceedance of enterococci lab precision goals. In addition to the audit and data review described above, the

BEACH Program Manager/Quality Assurance Officer verified to the best of their ability throughout the 2024 sampling period that:

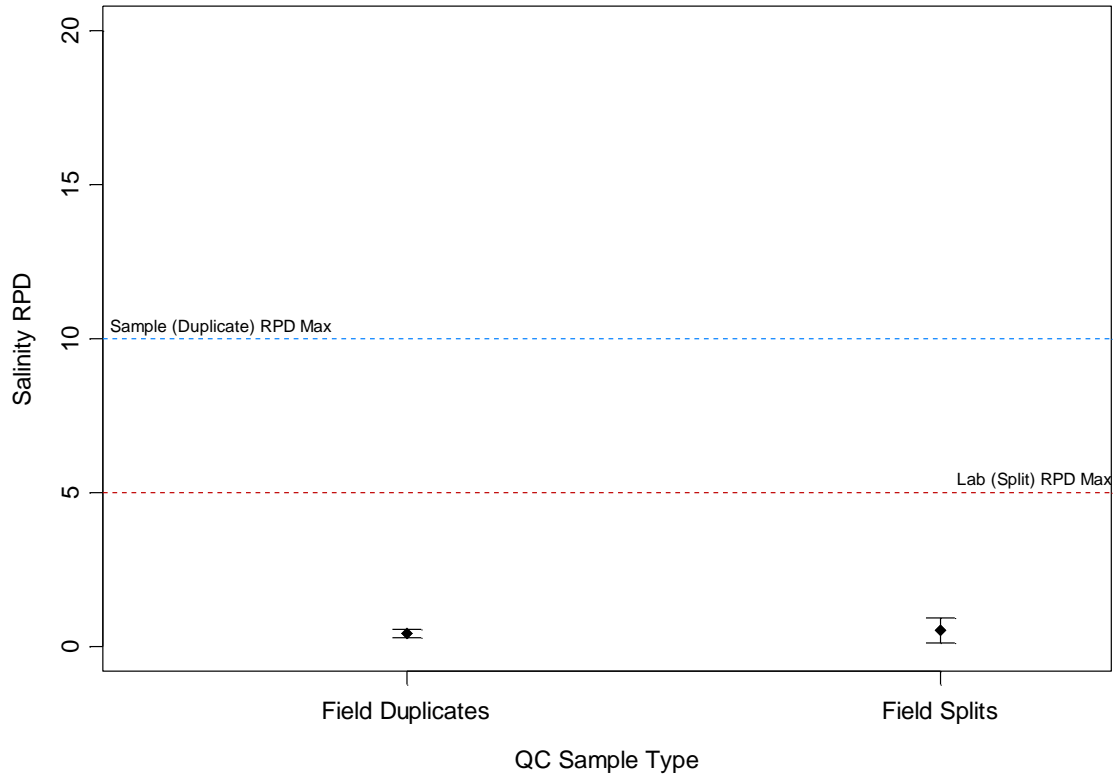

- All elements of the QAPP were being correctly implemented as prescribed;
- The quality of the data generated by implementation of the QAPP was adequate; and
- Corrective actions, when needed, were implemented in a timely manner and their effectiveness was confirmed.

All beach monitoring and notification data collected during 2024 have been uploaded to USEPA’s BEACH (PRAWN) and Water Quality Data systems via submission of an XML formatted file to the Exchange Network Services Center.

**Figure 5.** Comparison of 2024 monitoring season mean enterococci relative percent difference (RPD) for field duplicates and field splits with QAPP precision goals. Means are represented by diamonds and upper and lower 95th percentiles of the mean are shown as error bars.

**Figure 6.** Comparison of 2024 monitoring season mean salinity relative percent difference (RPD) for field duplicates and field splits with QAPP precision goals. Means are represented by diamonds and upper and lower 95<sup>th</sup> percentiles of the mean are shown as error bars.

10/29/2024	7:05	Low Tide		Clear	East-Southeast	Moderate (10-15 mph)	78	99	20.2	Routine

**APPENDIX D**

**Summary of Louisiana BEACH Program's  
Fulfillment of U.S. EPA's BEACH Grant Requirements**

### Summary of Louisiana BEACH Program’s Fulfillment of USEPA’s BEACH Grant Requirements

USEPA established nine performance criteria that eligible coastal or Great Lakes state, tribal, or local governments must meet to receive grants to implement coastal recreation water monitoring and public notification programs under the BEACH Act. Those criteria, together with a summary of how Louisiana has fulfilled each, are provided below.

Category	Performance Criterion	Louisiana’s Fulfillment of Criterion
<b>Evaluation and Classification</b>	1. Develop risk-based beach evaluation and classification plan	Identification of factors used to evaluate and rank beaches are provided in Chapter 2 of the <i>Louisiana’s BEACH Grant Final Report, Grant Year 2001</i> (the “Initial BEACH Report”; LDHH, 2003). More specifically: <ul style="list-style-type: none"> <li>• Coastal recreation waters are identified in Section 2.1.</li> <li>• Beaches used by the public for water contact activities within coastal recreation waters are identified in Section 2.2.</li> <li>• The original information describing (1) the potential risk to human health presented by pathogens and (2) the use of the beaches is provided in Sections 2.3-2.4 of the Initial Report. Information on the prior year’s water quality and projected level of use for each beach monitored under the Program are provided in Chapter 2 of the Program’s annual report.</li> <li>• EPA is notified annually of any change in beach rankings and other program changes in Chapter 2 of the Program’s annual report.</li> </ul>
<b>Monitoring</b>	2. Develop tiered monitoring plan	<ul style="list-style-type: none"> <li>• Chapter 3 of the Initial BEACH Report describes the Program’s monitoring plan, addressing the frequency and location of beach monitoring, and assessment criteria.</li> <li>• Chapter 2 of the Initial BEACH Report describes periods of recreational use of the waters, and nature and extent of use during certain periods.</li> <li>• Sample stations were established based on spatial use patterns as described in Chapter 2 of the Initial BEACH Report, adjusted for the proximity to known point and nonpoint sources of pollution.</li> <li>• Section 3.1 of the Initial BEACH Report outlines the Program’s quality control plan, which is described more completely in the Program’s current Quality Assurance Project Plan (QAPP).</li> </ul>
	3. Monitoring report submission and delegation	The Program reports monitoring data to the public, EPA, and other agencies through timely annual submission of those data to EPA’s STORET database. Additionally, the full data set and summaries are provided in the Program’s Annual Report.

	4. Methods and assessment procedures	Methods for detecting levels of pathogen indicators in coastal recreation areas are described in Section 3.3 of the Initial BEACH Report and the QAPP.
<b>Public Notification and Prompt Risk Communication</b>	5. Public notification and risk communication plan	Measures to notify the public, EPA, and local governments when indicator bacteria levels exceed a water quality standard are provided in Chapter 4 of the Initial BEACH Report.
	6. Measures to notify EPA and local governments	Measures to notify local governments and EPA when water quality standards are exceeded are provided in Chapter 4 of the Initial BEACH Report. The Program submits notification data and actions taken to notify the public to EPA’s PRAWN database annually.
	7. Measures to notify the public	Measures to notify the public when water quality standards are exceeded are provided in Chapter 4 of the Initial BEACH Report. Upon observing an exceedance of beach advisory criteria, the Program immediately issues a public notification or resamples for bacterial exceedance of a water quality standard in accordance with the QAPP. The notification is placed on the Program’s website, and signs posted at each station are changed to indicate that an advisory is in effect.
	8. Notification report submission and delegation	<ul style="list-style-type: none"> <li>• EPA and local governments are notified annually of any notification plan changes and any delegation of responsibilities in the Program’s annual work plan.</li> <li>• The Program reports actions taken to notify the public when water quality standards are exceeded in its annual PRAWN submission and in the Program’s annual report.</li> </ul>
<b>Public Evaluation</b>	9. Public evaluation of program	The Initial BEACH Report and all subsequent annual reports have been made available to the public for review and comment. The Program publishes a public notice informing the public of the availability of the annual report and the duration of the comment period, and the report is made available on the Program’s website.
