

ATU DO's & DON'Ts

DO's

✓ **DO** keep detailed records on your ATU. This includes model name, capacity, date installed, contract service agreements, records of service visits, and maintenance performed.

✓ **DO** conserve water to avoid overloading the system. Repair leaky faucets and toilets. Use water saving features on appliances.

✓ **DO** divert other sources of water like roof drains, house footing drains, and sump pumps away from the ATU.

✓ **DO** become familiar with how your system operates. Know the way it looks, smells, and sounds when operating properly.

DON'Ts

✗ **DON'T** allow anyone to park or drive over any part of your system.

✗ **DON'T** make or allow unauthorized repairs or changes to your ATU without obtaining a permit from the Parish Health Unit.

✗ **DON'T** use a garbage disposal without checking with the health department to make sure your ATU can accommodate this additional waste.

✗ **DON'T** attempt to clean or perform maintenance on any sealed ATU components.

✗ **DON'T** flush or pour any chemicals into your system.

Home Aerobic Treatment Units

What You Need to Know
About Your Home Sewage
System

DO NOT FLUSH...

- coffee grounds
- dental floss
- disposable diapers
- kitty litter
- sanitary napkins
- tampons
- cigarette butts
- condoms
- gauze bandages
- fat, grease, or oil
- paper towels

NEVER FLUSH CHEMICALS LIKE...

- paints
- varnishes
- thinners
- waste oils
- photographic solutions
- pesticides

These items can destroy the biological processes taking place in your sewage treatment system.

WARNING SIGNS

Watch for the following indications of problems with your aerobic treatment unit.

- Alarms or lights going off
- Changes in your system's normal operating sound
- Changes in the normal color of sewage in the aeration chamber (a greyish brown color rather than chocolate brown could indicate a problem)
- Excess solids, foam, or scum in the unit
- Plumbing backups
- Sewage odors in the house or yard

What is an aerobic treatment unit?

A home aerobic treatment unit (ATU) is a wastewater treatment machine whose main function is to treat household sewage. It is also referred to as a mechanical treatment plant. With proper design, operation, and maintenance ATU's can provide a high level of sewage treatment. They come in many shapes and sizes and are extremely important in protecting human health and the environment.

Why would an aerobic treatment unit be recommended for my house?

There are many reasons for utilizing an ATU for sewage treatment. All the factors below have a part in determining the appropriate sewage treatment method.

- Quality of the underlying soil
- Location of the water table
- Amount of land available
- Condition of surrounding waterways

How do aerobic treatment units work?

The following describes the ATU processes.

- 1. Pretreatment:** The first stage reduces the amount of solids (oils, grease, toilet paper, etc.) going into the ATU by utilizing a compartment to allow settling. This is optional.
- 2. Aeration:** The second stage forces oxygen to mix with the wastewater in the aeration chamber. This allows the beneficial bacteria to thrive and breakdown the sewage. Figure 1 is a typical schematic of an ATU without a pretreatment tank.
- 3. Clarifier:** This still chamber separates the solids created in the aeration chamber from the water. The solids fall to the bottom and back into the aeration chamber.
- 4. Disposal:** The final step includes disinfection and effluent reduction. These two processes are discussed below.

Figure 1: Typical Home Aerobic Treatment Unit

Disinfection destroys disease-causing microorganisms in the water leaving the ATU. A popular disinfection method is chlorination; using the stackable tablet device. In order for chlorination to be effective, the homeowner must remember to use the proper tablets and replace them as they are dissolved. Disinfection protects public health and is highly recommended.

Effluent Reduction is required to minimize the amount of wastewater being discharged. It is designed to maximize the use of the adsorptive capacity of the soil, even in poor soil conditions. There are many options for effluent reduction such as effluent reduction fields, rock plant filters, spray irrigation, overland flow systems, and mound systems. These systems are described in detail in the *Louisiana State Sanitary Code*.

Other important features of the ATU are the controls and alarms. The homeowner should become familiar with the control and alarm system. Alarms are required to alert the homeowner of malfunctions. The installer and/or maintenance provider should give the homeowner details on this important part of your system. Also, an operation and maintenance manual should be supplied with your system.

Why do I need to maintain my aerobic treatment unit?

Maintenance is key to the life and performance of ATU's. Poor maintenance can cause ATU failure, forcing expensive repairs or replacements at the homeowners expense. With proper care of any onsite sewage system, you can expect a long life and good performance.

Keep in mind that you could be putting your family's health at risk if you are discharging improperly treated wastewater into your yard or ditch. Sewage contains harmful bacteria, viruses, and parasites that can cause many illnesses.

How do I properly maintain my aerobic treatment unit?

One of the main design criteria of ATU's is the level of aeration provided for sewage treatment. Therefore, maintaining the blower is essential to the treatment process.

Another important issue is the sludge that builds up over time. Therefore, the ATU should be pumped periodically to remove the solids that settle to the bottom. The amount of organic matter entering the ATU will determine the pump schedule. A general rule of thumb is to pump it every 3 to 5 years.

With the purchase of any ATU, the first two years of service visits are included. You need to make sure those service visits are performed by your maintenance provider. After that you will have an option to renew the service agreement.

If you have any questions or concerns, please do not hesitate to contact us.
