Provisional Statistics

MONTHLY MORBIDITY APRIL/MAY, 1980

from

#### PUBLIC HEALTH STATISTICS EPIDEMIOLOGY UNIT AND

### LUNG CANCER IN LOUISIANA

Mortality rates for lung cancer in Louisiana and New Orleans are among the highest in the nation, particularly among males. During the 20-year period 1950 - 1969, Louisiana had the highest rate in the country for white males (51.97). Ten (10) Louisiana parishes rank in the top 18 counties nationally with rates exceeding 60/100,000 (See Table I).

These data clearly indicate the need for research on this important medical problem in our state. Several local teams of investigators have initiated research which, hopefully, will throw some light into the causation of this phenomenon. One of the most obvious needs in the field is to have an adequate data source to conduct epidemiology studies, including accurate measurement of morbidity

(continued on page 2)

### BULLETIN

## UPDATE-MALARIA AMONG NEWLY ARRIVING VIETNAMESE IN LOUISIANA

In the February 1980 issue of this bulletin, 17 cases of vivax malaria were reported among newly arriving Vietnamese refugees. Since that time an additional 19 cases have occurred. All except one have been diagnosed at Charity Hospital in New Orleans. All came from camps in Indonesia, tospital in New Orleans. All came from camps in incollecta, 25 from Sulgai Walang Camp on Bintan Island and 8 from a nearby island called Galang. All patients denied having malaria prior to leaving Vietnam. Most patients and their families became ill, however, while in Indonesia. Some received treatment but the type and duration of therapy is

The time between arrival in the United States and presentation to a medical facility ranged from 5 - 98 days (median 35 days). Ages of patients ranged from 2 - 55 years (median 18). There were 15 female and 21 male patients. The patients presented with typical clinical symptoms including fever, chills, headache, and diarrhea. Plasmodium vivax was identified in 35 cases and P. falciparum in one.

There were 4 patients with vivax malaria who received

documented treatment in the United States but subsequently relapsed. One was a pregnant woman who received chloro-quine but no primaquine; one was a child who received quinine but no primaquine. The third patient was diagnosed and treated for falciparum malaria in another state. He presented in Louisiana with vivax malaria and it appears that he may have had a dual infection with falciparum and vivax. The fourth patient, a child, received chloroquine and primaquine but in suboptimal doses.

#### **Editorial Comment**

This outbreak and the 4 cases who relapsed illustrate

several important points:

1. Physicians should have a high index of suspicion for the diagnosis of malaria in any Vietnamese refugee presenting with fever, especially if he/she has come to the United States via camps in Indonesia.

2. P. vivax is the predominant type of malaria being seen.

The average incubation period for *P. vivax* is 14 days but it may have a protracted incubation period of 8 to 10 months. Therefore, the diagnosis of *vivax* maiaria should be suspected in any Indochinese refugee presenting with typical symptoms as long as 10 months after arrival in the United States.

Primaquine is needed for radical cure of P. vivax. Treatment with chloroquine or quinine alone will not suffice to treat the exoerythrocytic phase of malaria and prevent relapses.

4. The dosage of antimalarials is usually quoted as mg. of salt and mg. of base. In calculating appropriate dosages especially for pediatric patients, the dosages of salt and base should not be confused.

 Laboratory confirmation of malaria should be at-tempted on all suspect cases by doing thick and thin blood smears. The thick film method is most likely to reveal the parasite, but repeated examinations may be necessary.

### DIAGNOSIS OF MOSQUITO - BORNE DISEASES

Occasionally physicians make clinical diagnoses of arthropod-borne viral diseases (arboviruses - e.g. dengue, St. Louis encephalitis [SLE]) without first obtaining serologic confirmation. This is a problem because a definitive diagnosis of these non-specific illnesses cannot be made without laboratory testing. Also, these diseases are not just of casual public health interest. Even one case of endogenous SLE or dengue would elicit an extensive public health response including intensive case finding and mosquito vector control activities.

As we enter the summer arbovirus season, we urge all physicians to obtain acute and convalescent sera (drawn at least 2 weeks apart) on all patients with encephalitis or any other suspicious arboviral illness. The sera should be submitted to the state laboratory through the local parish health units for testing. If there are any questions concerning the diagnosis of arboviral illnesses, please contact the local health unit or the State Communicable Disease Control Section (504-568-5005).

#### Lung Cancer in Louisiana (continued from page 1)

from cancer in the state. A very positive step in the right direction was the establishment in 1974 of a tumor registry for Orleans, Jefferson, and St. Bernard Parishes, funded by the National Cancer Institute. In 1978, State Law # 653 was passed authorizing a state-wide cancer registry program to be placed in the Office of Health Services and Environmental Quality (OHSEQ), which would collaborate with the tri-parish registry, now called the Division of Tumor Registry. However, lack of funds have prevented imple-

### TABLE 1

Mortality rates for lung cancer in white males, adjusted by the direct method to the 1960 United States population, 1950 – 1969, in counties with rates greater than 60/100,000 (1). NCI.

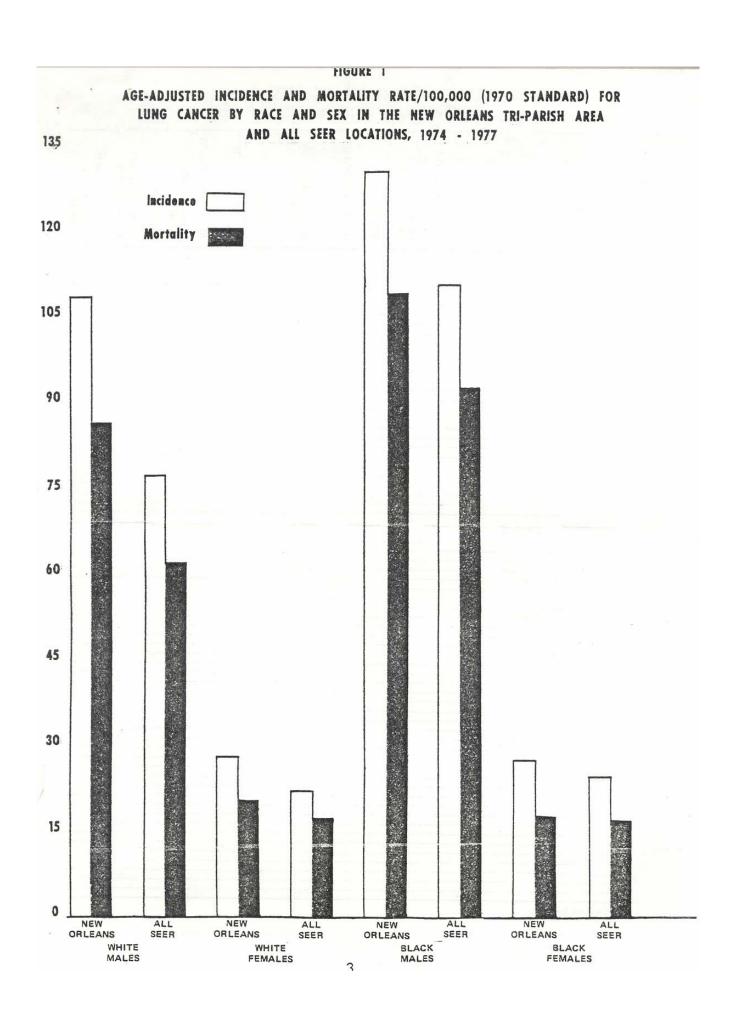

Rank County  1 Georgia – Forsyth 2 * Louisiana – St. Bernard 3 * Louisiana – Tensas	76.9
2 * Louisiana - St. Bernard	
* Louisiana — Tensas  * Louisiana — Terrebonne  Virginia — Charles City  * Louisiana — Concordia  * South Carolina — Charleston  Montana — Deer Lodge  * Louisiana — Orleans  Nevada — Storey  11 Georgia — Charlton  12 * Louisiana — Jefferson  13 * Louisiana — Iberia  Florida — Franklin  15 * Louisiana — St. Martin  Maryland — Baltimore  17 * Louisiana — Evangeline  18 * Louisiana — St. Charles	71.8 68.6 68.6 67.0 66.9 66.5 65.2 64.1 63.9 63.5 62.6 62.5 62.2 61.1 61.1 60.6 60.2

mentation of the statewide expansion. Local registries in several other cities in Louisiana, however, have been in operation for some time. It is hoped that they will be converted into population-based registries and eventually coordinated to provide accurate measurements of morbidity throughout the state.

The Division of Tumor Registry has made available incidence rates for the metropolitan area of Orleans, Jefferson, and St. Bernard Parishes for the years 1974 -1977. Figure I shows such data for lung cancer by race and sex, as compared to the average of the 11 registries which contributed to the Surveillance, Epidemiology, and End Results (SEER) Program of the National Cancer Institute. The other registries contributing to this system are Atlanta. Detroit, San Francisco, Seattle, Connecticut, Hawaii, Iowa, New Mexico, Utah, and Puerto Rico. The graph shows that black males have the highest rates in the city. The rates for black males were lower than those of white males in New Orleans according to the 1947 survey (white males, 45.1, vs. black males, 41.9). New Orleans white males have an incidence rate of 107.6/100,000 while the rate of the average of the 11 registries contributing to the SEER program is 76.4 (New Orleans' rate is 41% higher). The rates of the other sex and race groups are also greater than the SEER average: 129.6 for New Orleans black males vs. 110.0 for the SEER black males (17% higher), 27.4 for New Orleans white females vs. 21.8 for SEER white females (25% higher), and 27.5 for New Orleans black females vs. 24.3 for SEER black females (13% higher).

From January 1, 1980 thru April 30, 1980 the following cases were also reported: 1 - Leptospirosis; 1 - Stucellosis; 1 - 3lastomycosis; 1 - Cryptococcosis; 6 - Trichinosis.

<sup>\*</sup> Includes Rubella, Congenital Syndrome.

\* \* Acquired outside United States unless otherwise stated.
