\* Note: In reviewing the confirmed cases for amino acids and acylcarnitines disorders adjusting the cutoffs of 13 primary disorders.

### 2014 current cutoff vs 2015 new or retained cutoff data

CAH-Cutoffs	current		retained	
weight	cutoff	current %fp	cutoff	new %fp
0-1249 gms	≥150	0.36%	150	0.41%
1250-2249 gms	≥90	0.16%	90	0.16%
>2250 gms	≥40	0.19%	40	0.23%

Based on 2015 cumulative data no cutoff adjustments are necessary

Biotinidase cutoffs	current		suggested	
	cutoff	current %fp	cutoff	new %fp
	<50	0.019%	<55 *	0.070%

\* One confirmed biotinidase case had a value of 49.9 with a cutoff of 50

changing the cutoff from 50 to 55 based on the data would yield the same number of presumptive positive samples (37)

Galt cutoffs	current		retained	
	cutoff	current %fp	cutoff	new %fp
Normal	>3.5	0.24%	>3.5	0.21%
Borderline	3.1-3.5	0.08%	3.1-3.5	0.09%
Presumptive Positive	≤3.0	0.11%	≤3.0	0.09%

Immunoreactive Trypsinogen (IRT)	current		retained	
	cutoff	current %fp	cutoff	new %fp
	≥60	2.11%	≥60	2.30%

The lab has documentation of a confirmed case of CF with two mutations with an IRT value of 61.9 thus confirming the need to leave the cutoff at 60.

Thyroxine (T4)	Current cutoffs	current %fp	retained cutoff	new %fp
Age related cutoffs				
0 - 48 hours old	≤6	0.52%	≤6	0.58%
>48hours old	≤4	1.40%	≤4	1.80%

Thyroid Stimulating Hormone (TSH)	Current cutoff	current %fp	retained cutoff	new %fp
	≥25	0.74%	≥25	1.15%

There has been several confirmed cases of CH with TSH values slightly above the cutoff of 25 justifying keeping the cutoff at the current level

These recommendations are based on a review of the 2015 complete year data, the lab has not evaluated the 2016 data.
