

IMMUNIZATION COVID-19 UPDATE

ISSUE NO 36 | NOVEMBER 10, 2021

QUESTION OF THE WEEK:

How can I schedule an on-site COVID-19 vaccination clinic?

Louisiana businesses, schools, or other entities that want to quickly have their workforce or students vaccinated as easily and efficiently as possible can request on-site COVID vaccinations through the state's workplace or school vaccination programs.

Entities that are interested in this approach only need to supply enough physical space for pre-screening, conducting the vaccinations, and for after-shot observation.

Another option for employers and others is to have LDH arrange for a reserved set of appointments at a nearby community vaccine event.

Business On-site COVID-19 Vaccination Clinics

For more information about vaccinating your employees or setting up an on-site vaccination clinic at your businesses, call VieMed at 866-852-8343.

School On-site COVID-19 Vaccination Clinics

For schools, information about the program can be found on the LDH website at ldh.la.gov/schoolsignup.

If you have any questions or concerns about hosting an on-site vaccination event, please email la.immunization@la.gov.

WEEKLY COVID-19 VACCINE UPDATE

Regular Testing is Keeping Kids in Schools and COVID-19 Out

For the 2021-2022 school year in Louisiana, the Louisiana Office of Public Health (OPH) implemented the

Safer, Smarter, Schools program, a K-12 school-based COVID-19 testing program. The program is integral to Louisiana private, public, and charter schools being able to safely reopen and stay open.

This Safer, Smarter, Schools program preceded an announcement by the Biden administration last week to help states, schools, and school districts establish COVID-19 screening testing programs in more schools.

To date, Safer, Smarter Schools has proven very successful. Here are some of the most recent statistics:

- **Outbreaks Prevented:** 87% of the cases in participating schools have been limited to one or two people.
- **Tests per Week:** For the first 10 weeks of the program, an average of 1,860 people were tested each week.
- **Positive Test Comparisons:** In two participating school districts, there have been 230 COVID-positive tests. In the same two districts for non-participating schools, the number of positive results is 1,416.
- **Positive Cases per Week:** In participating school districts, there have been 32.8 COVID-positive results per week. In non-participating districts, the number of weekly positive cases is 202.3.

For more information on the Safer, Smarter Schools program, visit ldh.la.gov/safer-smarter-schools.

Pediatric COVID-19 Vaccine for Children Ages 5 to 11 Years

On Wednesday, November 3, CDC Director Rochelle P. Walensky, MD, MPH, endorsed the CDC Advisory Committee on Immunization Practices' (ACIP) recommendation that children 5 to 11 years old be vaccinated against COVID-19 with the Pfizer-BioNTech pediatric vaccine. CDC now expands vaccine recommendations to about 28 million children in the United States in this age group and allows providers to begin vaccinating them as soon as possible. Enrolled COVID-19 vaccination providers can continue to place orders for the Pfizer-BioNTech pediatric vaccine in LINKS.

COVID-19 cases in children can result in hospitalizations, deaths, multi-inflammatory syndrome in children (MIS-C), and long-term complications, such as "long COVID", in which symptoms can linger for months. The spread of the Delta variant resulted in a surge of COVID-19 cases in children throughout the summer. During a 6-week period in late June to mid-August, COVID-19 hospitalizations among children and adolescents increased fivefold.

Vaccination, along with other preventative measures, can protect children from COVID-19 using the safe and effective vaccines already recommended for use in adolescents and adults in the U.S. Similar to what was seen in adult vaccine trials, vaccination was nearly 91% effective in preventing COVID-19 among children ages 5 to 11 years old. In clinical trials, vaccine side effects were mild, self-limiting, and similar to those seen in adults and with other vaccines recommended for children. The most common side effect was a sore arm.

PEDIATRIC AND ADULT DOSE DIFFERENCES

Pediatric Dose	Adult Dose
For children ages 5 to 11 years old	For individuals ages 12 years and older
Orange cap	Purple cap
10 mcg	30 mcg
Injection volume: 0.2 mL	Injection volume: 0.3mL
Amount of diluent: 1.3 mL	Amount of diluent: 1.8 mL
Doses per vial: 10	Doses per vial: 6

Continued on page 3

STORAGE CONDITIONS DIFFERENCES

Pediatric Dose	Adult Dose
Ultra-Low Temperature (ULT) Freezer (-90° to -60°C): 6 months	Ultra-Low Temperature (ULT) Freezer (-90° to -60°C): 9 months
Freezer (-25° to -15°C): N/A	Freezer (-25° to -15°C): 2 weeks
Refrigerator (2° to 8°C): 10 weeks	Refrigerator (2° to 8°C): 1 month
Room temperature (8° to 25°C): 12 hours prior to dilution	Room temperature (8° to 25°C): 2 hours prior to dilution
After first puncture (2° to 25°C): Discard after 12 hours	After first puncture (2° to 25°C): Discard after 6 hours

Bust Common Myths and Learn the Facts about COVID-19

Can COVID-19 vaccines cause variants?

No. COVID-19 vaccines do not create or cause variants of the virus that causes COVID-19.

New variants of a virus happen because the virus that causes COVID-19 constantly adapts through a natural ongoing process of mutation (change). Even before the COVID-19 vaccines, there were several variants of the virus. Looking ahead, variants are expected to continue to emerge as the virus continues to change.

COVID-19 vaccines can help prevent new variants from emerging. As it spreads, the virus has more opportunities to change. High vaccination coverage in a population reduces the spread of the virus and helps prevent new variants from emerging. CDC recommends that everyone 12 years of age and older get vaccinated as soon as possible.

Learn more about [variants](#).

Do any of the COVID-19 vaccines authorized for use in the United States shed or release any of their components?

No. Vaccine shedding is the term used to describe the release or discharge of any of the vaccine components in or outside of the body. Vaccine shedding can only occur when a vaccine contains a weakened live version of the virus. None of the COVID vaccines authorized for use in the U.S. contain the virus. mRNA and viral vector vaccines are the two types of currently authorized COVID-19 vaccines available.
